Technical details are subject to change without further notice.

## Classification of Warning Messages and Safety Instructions

This manual contains noticeable descriptions, warning messages and safety instructions, which you must follow to avoid personal injuries or death and property damage.

This is the safety alert symbol.

It is used to alert you to potential personal injury hazards. Obey all safety messages and instructions that follow this symbol to avoid possible injury or death.

### DANGER, WARNING, CAUTION

Depending on the hazard level the signal words DANGER, WARNING or CAUTION are used to highlight safety instructions and warning messages. These messages may also include a warning relating to property damage.

#### DANGER

Danger statements indicate a hazardous situation which, if not avoided, will result in death or serious injury.

#### WARNING

Warning statements indicate a hazardous situation that, if not avoided, could result in death or serious injury.

#### CAUTION

Caution statements indicate a hazardous situation that, if not avoided, could result in minor or moderate injury.

### NOTICE

Notice statements are used to notify people on hazards that could result in things other than personal injury, like property damage.

#### NOTICE

This NOTICE statement indicates that the device contains components sensitive to electrostatic discharge.

#### NOTICE

This NOTICE statement contains the general mandatory sign and gives information that must be heeded and complied with for a safe use.

### INFORMATION

#### INFORMATION

Notes to point out something important or useful.

## Safety Instructions

- When working with the CAN-CBX-REL4/2 follow the instructions below and read the manual carefully to protect yourself from injury and the CAN-CBX-REL4/2 from damage.
- The CAN-CBX-REL4/2 module is considered safe in terms of the conformity assessment for CE marking for open equipment as specified in DIN EN 61131-2. You must install the module in a control cabinet that is designed for the specific environmental conditions and minimizes the risk of possible accidental contact with hazardous voltages. To improve electromagnetic immunity, the control cabinet should be made of metal and connected to earth potential. It must be secured with a locking mechanism that prevents access by unauthorized persons.
- Do not use damaged or defective cables to connect the CAN-CBX-REL4/2 and follow the CAN wiring hints in chapter: "Correct Wiring of Galvanically Isolated CAN Networks".
- In case of damages to the device, which might affect safety, appropriate and immediate measures must be taken, that exclude an endangerment of persons and domestic animals and property.
- The galvanic isolation of the CAN-CBX-REL4/2 has only functional tasks and is not a protection against hazardous electrical voltage.
- The CAN-CBX-REL4/2 is a device of protection class III according to DIN EN 61140 and may only be operated on supply circuits that offer sufficient protection against dangerous voltages.
- External circuits connected to the CAN-CBX-REL4/2 must be sufficiently protected against dangerous voltage.
- The module must be supplied with power supply units with double or reinforced insulation. The CAN-CBX-REL4/2 is intended for use in electric systems rated for overvoltage category II.
- The user is responsible for compliance with the applicable national safety regulations.
- Do not open the housing of the CAN-CBX-REL4/2 .
- The CAN-CBX-REL4/2 must be securely installed before commissioning.
- The permitted operating position is specified as shown (Figure 2). Other operating positions are not allowed.
- Never let liquids get inside CAN-CBX-REL4/2. Otherwise, electric shocks or short circuits may result.
- Protect the CAN-CBX-REL4/2 from dust, moisture, and steam.
- Protect the CAN-CBX-REL4/2 from shocks and vibrations.
- The CAN-CBX-REL4/2 may become warm during normal use. Always allow adequate ventilation around the CAN-CBX-REL4/2 and use care when handling
- Do not operate the CAN-CBX-REL4/2 adjacent to heat sources and do not expose it to unnecessary thermal radiation. Ensure an ambient temperature as specified in the technical data.

### **DANGER**

Risk of electric shock - Hazardous voltage

- A mixed assignment of the four relay ports with dangerous voltages and safety extra-low voltages ( $U_{AC} < 30\text{ V}$ , 42.4 V peak value or  $U_{DC} < 60\text{V}$ ) is not recommended, as the galvanic isolation between the ports only represents basic insulation!
- Before you switch on the supply voltage, check that all plug connectors are correctly seated.
- All current circuits which are connected to the device must be sufficiently protected against hazardous voltage, before you start with the installation.
- Ensure the absence of voltage before starting any electrical work.
- The user must ensure that the load circuits of the relays are protected against overload by suitable protective measures (e.g. shutdown devices)!

## Qualified Personnel

This documentation is directed exclusively towards personnel qualified in control and automation engineering. The installation and commissioning of the product may only be carried out by qualified personnel, which is authorized to put devices, systems, and electric circuits into operation according to the applicable national standards of safety engineering.

## Conformity

The CAN-CBX-REL4/2 is an industrial product and meets the demands of the EU regulations and EMC standards printed in the conformity declaration at the end of this manual.

### WARNING.

In a residential, commercial, or light industrial environment the CAN-CBX-REL4/2 may cause radio interferences in which case the user may be required to take adequate measures.

## Intended Use

The intended use of the CAN-CBX-REL4/2 is the operation as a CANopen module with four relay outputs. The guarantee given by esd does not cover damages which result from improper use, usage not in accordance with regulations or disregard of safety instructions and warnings.

- The CAN-CBX-REL4/2 is intended for indoor use only.
- The CAN-CBX-REL4/2 is intended for use in electric systems rated for overvoltage category II.
- The operation of the CAN-CBX-REL4/2 in hazardous areas, or areas exposed to potentially explosive materials is not permitted.
- The operation of the CAN-CBX-REL4/2 for medical purposes is prohibited.

## Service Note

The CAN-CBX-REL4/2 does not contain any parts that require maintenance by the user. The CAN-CBX-REL4/2 does not require any manual configuration of the hardware. Unauthorized intervention in the device voids warranty claims

## Disposal

Products marked with a crossed-out dustbin must not be disposed of with household waste. Devices which have become defective in the long run must be disposed in an appropriate way or must be returned to the manufacturer for proper disposal. Please, contribute to environmental protection.

---

## Typographical Conventions

Throughout this manual the following typographical conventions are used to distinguish technical terms.

| Convention             | Example  |
|------------------------|--|
| File and path names    | <code>/dev/null</code> or <code>&lt;stdio.h&gt;</code> |
| Function names         | <code><i>open()</i></code>                             |
| Programming constants  | <code>NULL</code>                                      |
| Programming data types | <code>uint32_t</code>                                  |
| Variable names         | <code><i>Count</i></code>                              |

## Number Representation

All numbers in this document are base 10 unless designated otherwise. Hexadecimal numbers have a prefix of 0x. For example, 42 is represented as 0x2A in hexadecimal notation.

# 1 Overview

## 1.1 About this Manual

This manual describes the hardware and the software of the CAN-CBX-REL4/2 module.

## 1.2 Description of CAN-CBX-REL4/2

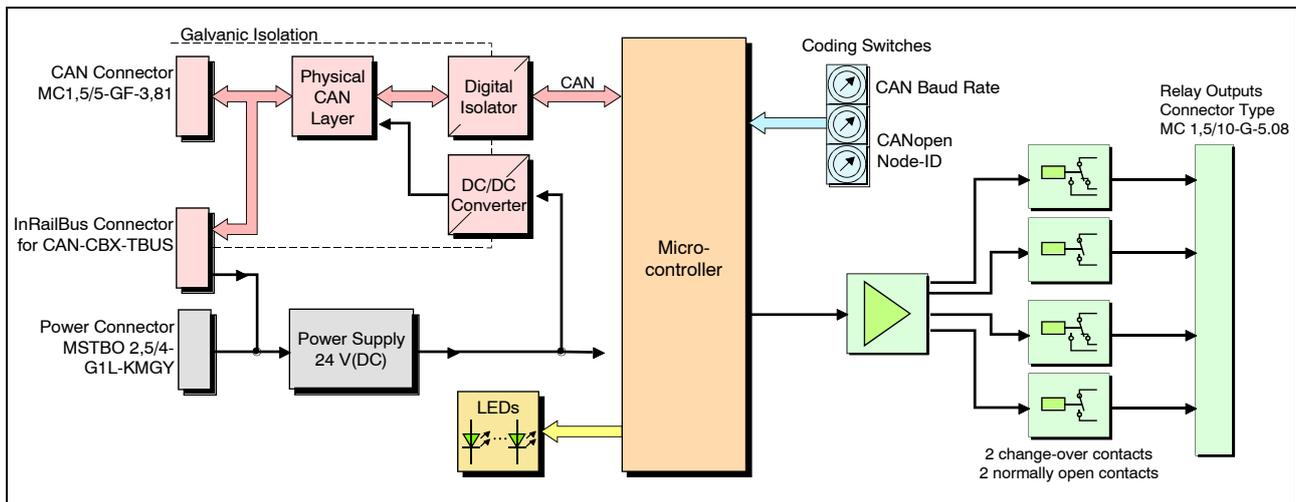

Figure 1: Block circuit diagram

The CAN-CBX-REL4/2 module offers a total of four monostable relay outputs. Two of these are designed as change-over contacts and two as normally open (make) contacts.

The relays reliably switch up to 8 A for up to 100,000 times.

Due to the galvanic isolation of the individual ports, different voltages can be connected to the CAN-CBX-REL4/2 module at the same time.

### NOTICE

A mixed assignment of the four relay ports with dangerous voltages and safety extra-low voltages ( $U_{AC} < 30\text{ V}$ , 42.4 V peak value or  $U_{DC} < 60\text{ V}$ ) is not recommended, as the galvanic isolation between the ports only represents basic insulation!

The module features a High-Speed CAN CC interface compliant with ISO11898 standards. It offers galvanic isolation and supports bit rates up to 1 Mbit/s. CANopen node number and the CAN bit rate are configured conveniently via coding switches.

The module is connection-compatible with the predecessor module CAN-CBX-REL/4 (C.3012.02) and the functionality is largely identical.

Each relay has a dedicated LED that indicates the status, while four additional LEDs clearly visualize the status of the CANopen node and I/O errors.

CANopen® integration is ensured in accordance with the CiA® specifications:

- CiA® 301 “CANopen application layer and communication profile” (1)
- CiA® 401 “CANopen profile for I/O devices” (2)

As extended switching and error functions the CAN-CBX-REL4/2 offers simultaneous switching of up to 32 relays with one PDO/CAN frame and an automatic switchover to the specified state in the event of system errors.

The CAN-CBX-REL4/2 can be easily combined with other modules of esd’s CBX Series.

## Overview

---

The CBX module series offers compact industrial CAN input/output modules with InRailBus. These modules feature an efficient wiring concept for CAN and supply voltage and are housed in a slim design that focuses on usability.

The InRailBus simplifies the supply of power and CAN bus signals. For user-friendly installation, the CAN-CBX-REL4/2 can be seamlessly integrated into the DIN rail via an optional connector (TBUS connector, see page 111). At the same time, individual modules can be removed from the InRailBus without interrupting the bus signals, which enables efficient maintenance. Alternatively, power and signals can also be connected separately via the terminal connections.

We offer customization options to meet your specific needs. For detailed information, kindly reach out to our sales team.

## 1.3 Glossary

### Abbreviations

| Abbreviation | Term                              | Description   |
|--------------|-----------------------------------|---|
| API          | Application Programming Interface |   |
| CAN          | Controller Area Network           | In this manual the term CAN only includes CAN CC.<br>CAN-CBX-REL4/2 supports CAN CC.<br>CAN FD and CAN XL are not supported |
| CAN CC       | CAN classic                       |   |
| CAN FD       | CAN flexible data rate            | Not supported by CAN-CBX-REL4/2   |
| CPU          | Central Processing Unit           |   |
| CiA          | CAN in Automation                 |   |
| EDS          | Electronic Data Sheet             | Description file for CANopen devices  |
| HW           | Hardware                          |   |
| I/O          | Input/Output                      |   |
| LSB          | Least Significant Bit             |   |
| MSB          | Most Significant Bit              |   |
| n.a.         | not applicable                    |   |

## 2 Hardware

### 2.1 Connecting Diagram

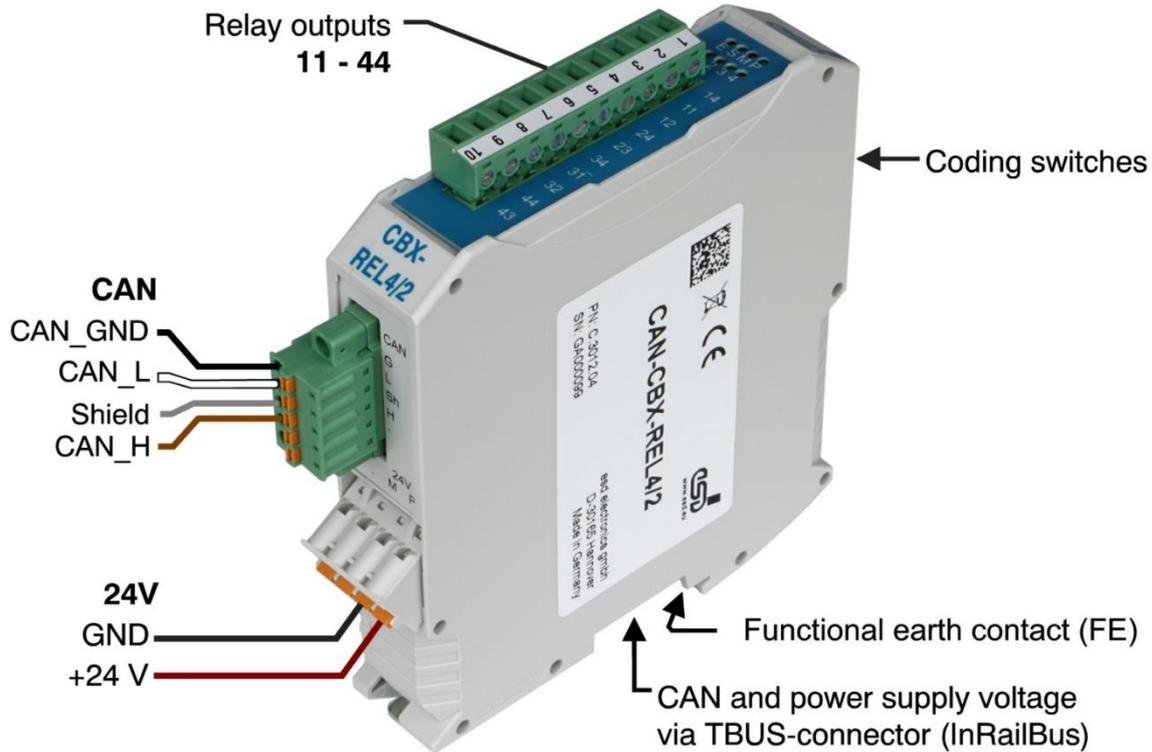

Figure 2: Connecting diagram of CAN-CBX-REL4/2

See also page 92 for signal assignment of the CAN connectors.  
For conductor connection and conductor cross section see page 97.

#### NOTICE

Read chapter "Installing and Uninstalling Hardware" from page 20, before you start with the installation of the hardware!

## 2.2 LEDs

### 2.2.1 Position of the LEDs

The CAN-CBX-REL4/2 module is equipped with four Status LEDs and four relay LEDs. The terms of the indicator states of the LEDs are chosen in accordance with the terms recommended by the CiA (3). The indicator states of the LEDs are described in the following chapters.

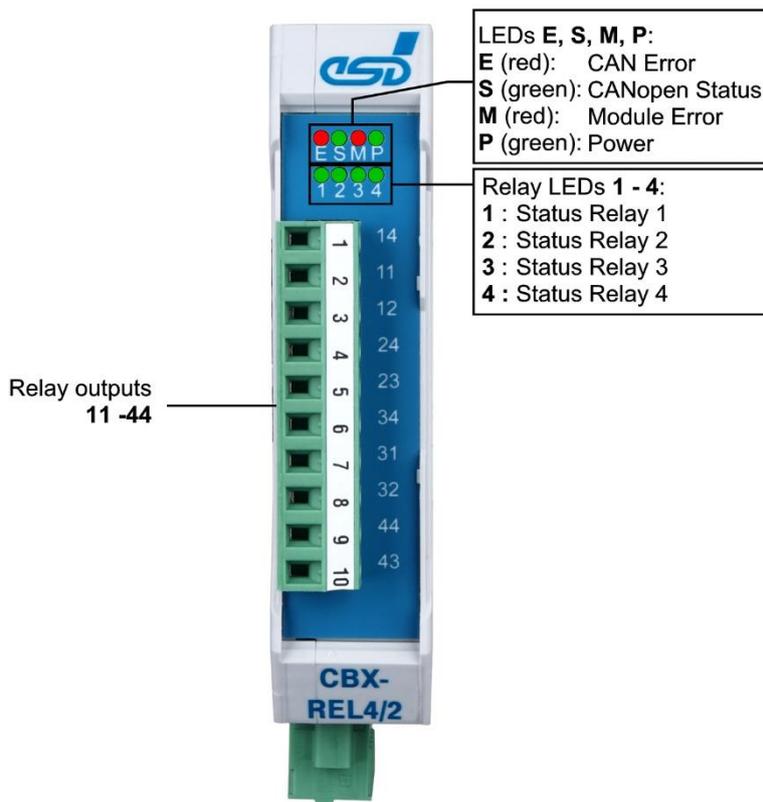

Figure 3: Connectors and LEDs

### 2.2.2 Relay LEDs 1 - 4

The four lower green LEDs show the states of the relays.

| LED | Function      | Indication        |                      |
|-----|---------------|-------------------|----------------------|
|     |               | LED on            | LED off              |
| 1   | Status Relay1 | Relay 1 energized | Relay 1 de-energized |
| 2   | Status Relay2 | Relay 2 energized | Relay 2 de-energized |
| 3   | Status Relay3 | Relay 3 energized | Relay 3 de-energized |
| 4   | Status Relay4 | Relay 4 energized | Relay 4 de-energized |

Table 1: Description of LEDs

## 2.2.3 Indicator States

In principle there are 8 indicator states distinguished:

| Indicator state | Display   |
|-----------------|---|
| On              | LED constantly on   |
| Off             | LED constantly off  |
| Blinking        | LED blinking with a frequency of approx. 2.5 Hz   |
| Flickering      | LED flickering with a frequency of approx. 10 Hz  |
| Single flash    | One single flash<br>(1x (LED 200 ms on, 1000 ms off))                                     |
| Double flash    | Two short flashes<br>(1x (LED 200 ms on, 200 ms off) + 1x (LED 200 ms on 1000 ms off))    |
| Triple flash    | Three short flashes<br>(2x (LED 200 ms on, 200 ms off) + 1x (LED 200 ms on, 1000 ms off)) |

Table 2: Indicator states

### NOTICE

Red and green LEDs are strictly switched in phase opposition according to the CANopen Specification (3)

For certain indicator states viewing all LEDs together might lead to a misinterpretation of the indicator states of adjacent LEDs. It is therefore recommended to look at the indicator state of an LED individually, in covering the adjacent LEDs.

## 2.2.4 Operation of the CAN-Error LED 'E'

| Label | Name      | Colour | Indicator state | Description   |
|-------|-----------|--------|-----------------|---|
| E     | CAN Error | red    | Off             | No error  |
|       |           |        | Single flash    | CAN controller is in <i>Error Active</i> state  |
|       |           |        | On              | CAN controller state is <i>Bus Off</i><br>(or coding switch position ID-node > 7F <sub>h</sub> when switching on; see Special Indicator States' on page 17) |
|       |           |        | Double flash    | Heartbeat or Nodeguard error occurred.<br>The LED automatically turns off if Nodeguard/Heartbeat-messages are received again.                               |

Table 3: Indicator states of the red CAN Error-LED

## 2.2.5 Operation of the CANopen-Status LED 'S'

| Label | Name           | Colour | Indicator state | Description            |
|-------|----------------|--------|-----------------|------------------------|
| S     | CANopen Status | green  | blinking        | <i>Pre-operational</i> |
|       |                |        | on              | <i>Operational</i>     |
|       |                |        | Single flash    | <i>Stopped</i>         |

Table 4: Indicator states of the CANopen Status-LED

## 2.2.6 Operation of the Error-LED 'M'

| Label | Name  | Colour | Indicator state | Description  |
|-------|-------|--------|-----------------|--|
| M     | Error | red    | Off             | No error   |
|       |       |        | On              | Error on an error-controlled output<br>- If the module has switched to the state <i>stopped</i> due to an error, the LED remains on, even if the error is no longer existing<br>- Errors that occur after changing to <i>stopped</i> state are not indicated |
|       |       |        | Double flash    | Internal software error, e.g.:<br>- Stored data have an invalid checksum, therefore default values are loaded<br>- Internal watchdog has triggered<br>- Indicator state is continued until the module resets or an error occurs at the outputs.              |

Table 5: Indicator state of the Error-LED

## 2.2.7 Operation of the Module Status LED ‘P’

| Label | Name          | Colour | Indicator state | Description                |
|-------|---------------|--------|-----------------|----------------------------|
| P     | Module Status | green  | Off             | No power supply voltage    |
|       |               |        | On              | Power supply voltage is on |

Table 6: Indicator state of the Power-LED

## 2.2.8 Special Indicator States

The special indicator state described in the following table is indicated by the CANopen-Status-LED and the CAN-Error-LED together:

| LED indication  | Description  |
|---|--|
| CANopen-Status LED: Triple flash and<br>CAN-Error LED: On | The coding switches for the node-ID are set to an invalid ID-value, when switching on. The firmware application will be stopped. |

Table 7: Special Indicator States

## 2.3 Coding Switch

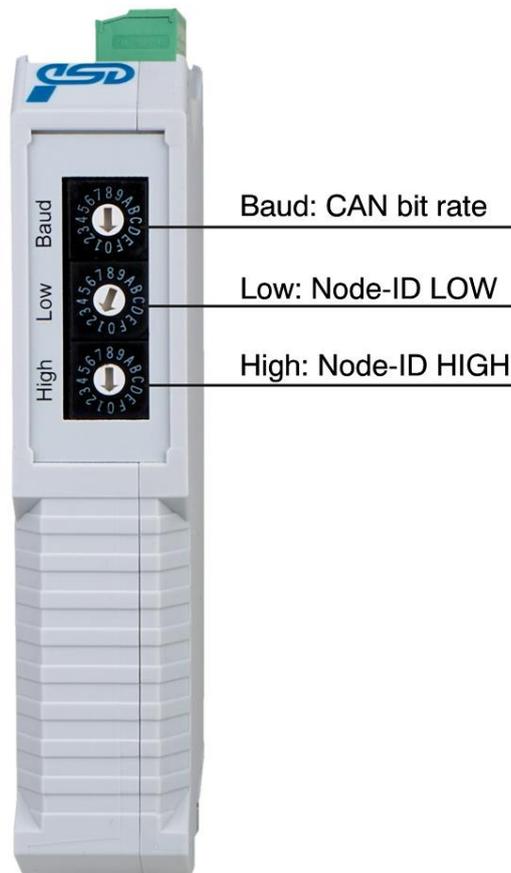

Figure 4: Position of the coding switches

### NOTICE

The states of the coding switches are determined the moment the module is switched on. Changes of the settings must therefore be made **before the module is switched on**, as changes of the settings are not detected during operation. After a reset (e.g. NMT reset), the settings are read in again.

### 2.3.1 Setting the Node-ID via Coding Switch

The address range of the CAN-CBX-module can be set decimal from 1 to 127 or hexadecimal from 0x01 to 0x7F.

The three higher-order bits (higher-order nibble) can be set with coding switch **HIGH**.

The four lower-order bits (lower-order nibble) can be set with coding switch **LOW**.

### NOTICE

Avoid the following settings:

- Setting the address range of the coding switches to 0x00 or values higher than 0x7F causes error messages, the red CAN-Error LED is on.

## 2.3.2 Setting the Bit Rate

The bit rate can be set with the coding switch **Baud**.

Values from 0x0 to 0xF can be set via the coding switch. The values of the bit rate can be taken from the following table:

| Setting | Bit rate [kbit/s] |
|---------|-------------------|
| 0       | 1000              |
| 1       | 666. $\bar{6}$    |
| 2       | 500               |
| 3       | 333. $\bar{3}$    |
| 4       | 250               |
| 5       | 166. $\bar{6}$    |
| 6       | 125               |
| 7       | 100               |
| 8       | 66. $\bar{6}$     |
| 9       | 50                |
| A       | 33. $\bar{3}$     |
| B       | 20                |
| C       | 12.5              |
| D       | 10                |
| E       | 800               |
| F       | 83. $\bar{3}$     |

Table 8: Index of the bit rate

# 3 Installing and Uninstalling Hardware

To install or uninstall the CAN-CBX-REL4/2, please follow the installation notes.

| Step  | Procedure   | See Page |
|---|---|----------|
|    | <b>NOTICE</b><br>Read the safety instructions at the beginning of this document carefully before you start with the hardware installation/!   | 5        |
|    | <b>DANGER</b><br>Hazardous voltage - Risk of electric shock due to unintentional contact with uninsulated live parts with high voltages inside of the system into which the CAN-CBX-REL4/2 is to be integrated.<br><br>→ The CAN-CBX-REL4/2 is a device of protection class III according to DIN EN 61140 and may only be operated on supply circuits that offer sufficient protection against dangerous voltages.<br>→ External circuits connected to the CAN-CBX-REL4/2 must be sufficiently protected against dangerous voltages.<br>→ Compliance with the applicable national safety regulations is the responsibility of the user.<br>→ Ensure the absence of voltage before starting any electrical work.<br>→ The plug connectors must not be plugged in or unplugged under voltage or load! |          |
| To install, continue as described in chapter 3.1 'Installing the Hardware'.<br>To uninstall, continue as described in chapter 3.2 'Uninstalling the Hardware' |   |          |

## 3.1 Installing the Hardware

| Step  | Procedure  | See Page |
|---|--|----------|
| 1.  | Follow the safety instructions at the beginning of chapter 3   | 20       |
| 2.  | Mount the CAN-CBX-REL4/2 module in the control cabinet.<br>Connect the ports (power supply voltage, CAN, relays).  | 13       |
|   | See also chapter Connector Assignments   | 92       |
|   | If the InRailBus is used, read and follow chapter Using InRailBus  | 22       |
|  | <b>NOTICE</b><br>Incorrect wiring of the 24V power supply voltage can cause damage to the module!<br><br>→ Make sure to connect the cables correctly to the 24V cable connector!<br>→ Only use suitable cables for the plug.   | 93       |
| 3.  | Please note that the CAN bus must be terminated at both ends!<br>esd offers special T-connectors and termination connectors for external termination. Additionally, the CAN_GND signal must be connected to earth at exactly one point in the CAN network.<br>For details, please read chapter "Correct Wiring of Galvanically Isolated CAN Networks". | 98       |

|    |   |    |
|----|---|----|
| 4. | Set the configuration switches according to your needs or program the CAN-CBX-REL4/2 as needed.<br>Set the bit rate (only if another bit rate than the default bit rate is requested.)<br>The default bit rate is 1 Mbit/s. It can be configured via the coding switch BAUD, as described in chapter 2.3.2. | 19 |
| 5. | Set the module number (Node-ID), see chapter 2.3.1.<br>The node-ID can be configured via the coding switches LOW und HIGH.<br>It can be set to values between 1 and 127 (0x01-0x7F).<br>Example: For node- ID 1 the coding switch LOW has to be set to '1' and the coding switch HIGH has to be set to '0'. | 18 |
| 6. | Before you switch on the supply voltage, check that all plug connectors are correctly seated.<br>Switch on the 24 V-power supply voltage of the CAN-CBX-REL4/2.   | -  |

### 3.2 Uninstalling the Hardware

| Step | Procedure   | See Page |
|------|---|----------|
| 1.   | Follow the safety instructions at the beginning of chapter 3  | 20       |
| 2.   | Make sure that all connected interfaces and power supply are switched off.  |          |
| 3.   | Disconnect the CAN-CBX-REL4/2 from the connected interfaces.  |          |
| 4.   | Use a screwdriver to pull the fastening spring downwards while swivelling the CAN-CBX-REL4/2 module upwards until it comes loose. |          |
| 5.   | Carefully remove the CAN-CBX-REL4/2.  |          |

### 3.3 Using InRailBus

This chapter describes the installation of the module using InRailBus as an example for CAN-CBX-modules. The InRailBus connectors are not included in delivery

#### 3.3.1 Installation of the Module when using the InRailBus Connector

If the CAN bus signals and the power supply voltage shall be fed via the InRailBus, please proceed as follows:

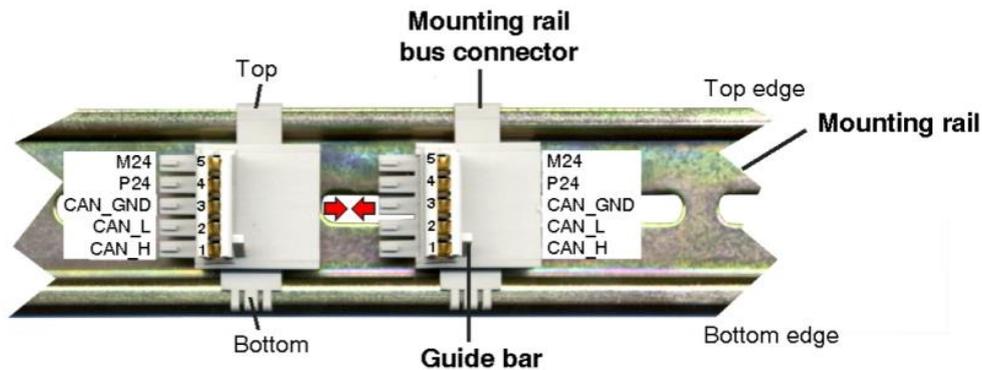

Figure 5: Mounting rail with bus connector

1. Position the InRailBus connector on the mounting rail and snap it onto the mounting rail using slight pressure. Plug the bus connectors together to contact the communication and power signals (in parallel with one). The bus connectors can be plugged together before or after the CAN-CBX module is plugged on.
2. Hold the CAN-CBX module tilted backwards at a slight angle and place it on the bus connector so that the DIN rail guideway is placed on the top edge of the mounting rail.

Figure 6: Mounting CAN-CBX modules

3. Now swivel the CAN-CBX module onto the mounting rail by moving the module downwards according to the direction of the arrow in Figure 6. The housing is mechanically guided by the guide bar of the bus connector.
4. When mounting the CAN-CBX module the moveable snap-on foot snaps onto the bottom edge of the mounting rail.  
The module is now firmly seated on the mounting rail and is connected to the InRailBus via the bus connector. If necessary, connect the bus connectors to each other and connect the +24 V supply voltage and the CAN interface to the InRailBus as described below.

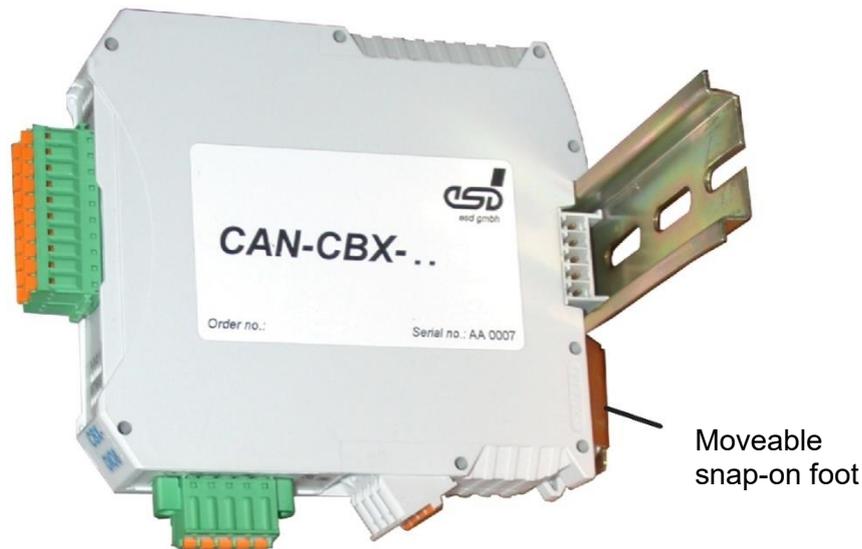

Figure 7: Mounted CAN-CBX module

### 3.3.2 Connecting via the InRailBus

To connect the power supply and the CAN signals via the InRailBus, a terminal plug is needed. The terminal plug is not included in the scope of delivery and must be ordered separately (order no.: C.3000.02, see order information for InRailBus Accessories).

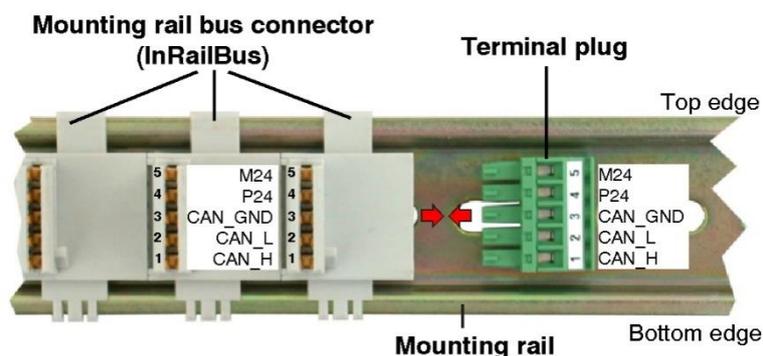

Figure 8: Mounting rail with InRailBus and terminal plug

Insert the terminal plug from the right into the socket side of the outer mounting rail bus connector of the InRailBus, as shown in Figure 8. Then connect the CAN interface and the supply voltage via the terminal plug.

### 3.3.3 Connection of the Supply Voltage

#### DANGER

**Hazardous Voltage - Risk of electric shock** due to unintentional contact with uninsulated live parts with high voltages inside of the system into which the CAN-CBX-module is to be integrated.

- Read the safety instructions at the beginning of this document (from page 5) carefully before you start with the hardware installation!
- Ensure the absence of voltage before starting any electrical work.
- Switch off the power supply, before you connect it to the system.

#### DANGER

The CAN-CBX-REL4/2 is a device of protection class III according to DIN EN 61140 and may only be operated on supply circuits that offer sufficient protection against dangerous voltages.

There are two ways to feed the 24 V power supply voltage into the CBX station:

- via the terminal plug of the InRailBus, see 3.3.3.1
- via the 24 V connector of the first module in the CBX station, see 3.3.3.2

#### NOTICE

The two connections for the 24 V power supply (via InRailBus or 24 V connector) are connected internally and must not be supplied by two independent power sources at the same time!

Connecting 24 V at both connectors will cause damage to the CAN-CBX module.

Also read the chapter on the assignment of the 24 V connector for further information.

#### 3.3.3.1 Connection of the Power Supply Voltage via InRailBus

#### NOTICE

If you feed the 24V power supply via the terminal plug of the InRailBus (see Figure below), the maximum load current must not exceed  $I_{MAX\_LOAD\_InRailBus} = 8\text{ A}$ .

Figure 9:  
Connection via  
terminal plug

## 3.3.3.2 Connection of the Power Supply Voltage via 24 V Connector

### NOTICE

Note that the connection between the 24V plug and the InRailBus is not designed to feed the 24V supply voltage via the plug to the InRailBus!

If the modules are mounted on the DIN rail without InRailBus connectors, it is allowed to bridge the power supply from one module to another (see Figure below), but the maximum load current must not exceed  $I_{MAX\_LOAD\_24V\_plug} = 2 \text{ A}$ .

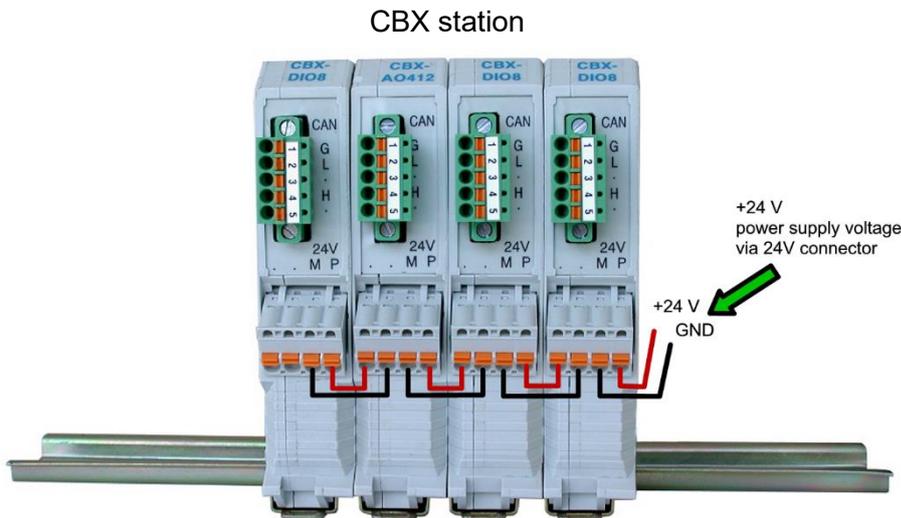

Figure 10:  
Connection via  
24V Connector

## 3.3.3.3 Earthing of the Mounting Rail

### NOTICE

The module is connected to the mounting rail via its functional earth contact. This improves the stability against electromagnetic disturbances. The mounting rail must therefore be connected to a suitable functional earth contact in the environment or in the installation. It must be ensured that the impedance of the connection is kept low. The functional earth contact of the module does not ensure electrical safety.

### 3.3.4 Connection of CAN

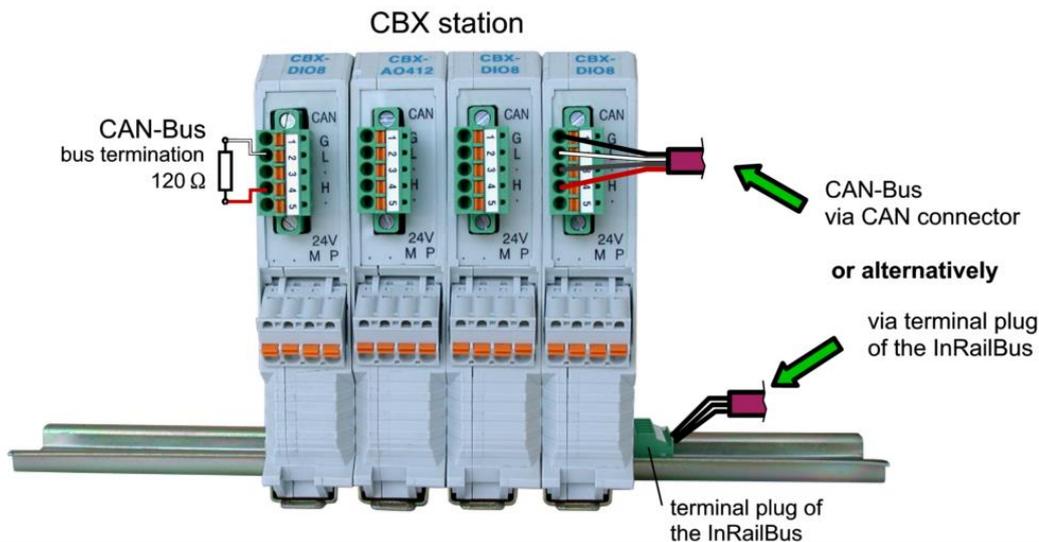

Figure 11: Connecting the CAN signals to the CAN-CBX station

In general, the CAN signals can be fed in via the InRailBus or via the CAN connector of the first CAN-CBX module in the CAN-CBX station. The signals are then connected through the CAN-CBX station via the InRailBus. The CAN signals may be lead through via the CAN connector of the CAN-CBX module mounted at the other end of the CBX station. However, the CAN signals must not be connected via the CAN connectors of the middle CAN-CBX modules of the CBX station, as this would lead to impermissible branching.

Please note that a bus terminating resistor must be connected to the CAN-CBX module located at the end of the InRailBus if the CAN bus ends there (see Figure 11).

### 3.3.5 Remove the CAN-CBX Module from InRailBus

If the CAN-CBX module is only connected via the InRailBus, proceed as follows when removing it: Release the module from the mounting rail by moving the snap-on foot (see Figure 7) downwards (e.g., with a screwdriver). This releases the module from the bottom edge of the mounting rail, and it can be removed.

#### INFORMATION

It is possible to remove individual devices from the CBX station without interrupting the InRailBus connection, because the contact chain will not be disrupted.

## 4 CANopen Firmware

The CAN-CBX-REL4/2 presents itself as a CANopen responder device. The "Relay On" and "Relay Off" functions conform to the CiA<sup>®</sup> profile CiA 401.

The EDS file can be downloaded under *Software Downloads* from the CAN-CBX-REL4/2 product page on esd website <https://esd.eu/en/products/can-cbx-rel4>.

For the purpose of backwards compatibility, the CAN-CBX-REL4/2 can also be operated with the EDS file of the predecessor module CAN-CBX-REL4 (within the scope of the functions of the predecessor module). The properties and functions described in the manual (v.1.1) of the CAN-CBX-REL4 predecessor module in section 7 are supported.

It is possible to update the firmware via CANopen in the field.

Apart from basic descriptions of CANopen, this chapter contains the most significant information about the implemented functions.

A complete CANopen description is too extensive for the purpose of this manual.

Further information can therefore be taken from the CiA<sup>®</sup> CANopen documentation (1) and (2).

### 4.1 Definition of Terms

| Name            | Description                                 |
|-----------------|---|
| COB ...         | Communication Object                        |
| Emergency-Id... | Emergency Data Object                       |
| NMT...          | Network Management (Manager)                |
| PDOs            | Process Data Object (see description below) |
| Rx ...          | Receive                                     |
| SDO             | Service Data Object (see description below) |
| Sync...         | Sync(frame) Telegram                        |
| Tx ...          | Transmit                                    |

#### Description of SDO and PDO

##### SDO (Service Data Object)

SDOs are used to transmit module internal configuration- and parameter data. In opposition to the PDOs, SDO-messages are confirmed.

A write or read request on a data object is always answered by a response telegram with an error index.

##### PDOs (Process Data Objects)

PDOs are used to transmit process data.

In the 'Transmit'-PDO (TPDO) the CAN-CBX-module transmits data to the CANopen network.

In the 'Receive'-PDO (RPDO) the CAN-CBX-module receives data from the CANopen network.

## 4.2 NMT-Boot-up

The CAN-CBX module can be initialized with the 'Minimum Capability Device' boot-up as described in (1).

Usually, a telegram to switch from *Pre-operational* status to the *Operational* status after boot-up is sufficient. For this the 2-byte telegram '0x01', '0x00', for example, must be transmitted with CAN identifier '0x0000' (= Start Remote Node all Devices).

## 4.3 The CANopen-Object Directory

The object directory is basically a (sorted) group of objects which can be accessed via the CAN network. Each object in this directory is addressed with a 16-bit index. The index in the object directories is represented in hexadecimal format.

The index can be a 16-bit parameter in accordance with the CANopen specification (1) or a manufacturer-specific code. By means of the MSBs of the index the object class of the parameter is defined.

Part of the object directory are among others:

| Index             | Object                             |
|-------------------|------------------------------------|
| 0x0001 ... 0x009F | Definition of data types           |
| 0x1000 ... 0x1FFF | Communication Profile Area         |
| 0x2000 ... 0x5FFF | Manufacturer Specific Profile Area |
| 0x6000 ... 0x9FFF | Standardized Device Profile Area   |
| 0xA000 ... 0xFFFF | Reserved                           |

## 4.4 Communication Parameters of the PDOs

The communication parameters of the PDOs (according to (1)) are transmitted as SDO (Service Data Objects) on ID '**0x600 + Node-ID**' (Request).

The receiver acknowledges the parameters on ID '**0x580 + Node-ID**' (Response).

The Node-ID (module No.) is configured via coding switches Low and High. Please refer to chapter "Coding Switches" for a detailed description of possible configurations.

### 4.4.1 Access on the Object Directory via SDOs

The SDOs (Service Data Objects) are used to access the object directory of a device.

An SDO is therefore a 'channel' to access the parameters of the device. Access via this channel is possible in *Operational* and *Pre-operational* status.

The SDOs (Service Data Objects) are transmitted on ID '**0x600 + Node-ID**' (request).

The server acknowledges the parameters on ID '**0x580 + Node-ID**' (response).

**An SDO is structured as follows:**

| Identifier        | Command code    | Index                                     |        | Sub-index  | LSB                      | Data field |      | MSB  |
|-------------------|-----------------|---|--------|------------|--------------------------|------------|------|------|
|                   |                 | (low)                                     | (high) |            |                          |            |      |      |
| Example:          |                 |   |        |            |                          |            |      |      |
| 0x600+<br>Node-ID | 0x23<br>(write) | 0x00                                      | 0x14   | 0x01       | 0x7F                     | 0x04       | 0x00 | 0x00 |
|                   |                 | (Index=0x1400)<br>(Receive-PDO-Comm-Para) |        | (COB-def.) | COB Node ID = 0x0000047F |            |      |      |

**Identifier**

The parameters are transmitted with ID '0x600 + NodeID' (request).

The receiver acknowledges the parameters with ID '0x580 + NodeID' (response).

**Command code**

The command code transmitted consists among other things of the Command Specifier and the length.

Frequently required combinations are, for instance:

0x40 (= 64 decimal): Read Request, i.e. a parameter is to be read.

0x23 (= 35 (decimal): Write Request with 32-bit data, i.e. a parameter is to be set.

**Response telegram**

The CAN-CBX-module responds to every received telegram with a response telegram. This can contain the following command codes:

0x43 (= 67 decimal): Read Response with 32-bit data, this telegram contains the parameter requested

0x60 (= 96 decimal): Write Response, i.e. a parameter has been set successfully

0x80 (= 128 decimal): Error Response, i.e. the CAN-CBX-module reports a communication error

**Frequently Used Command Codes**

The following table summarizes frequently used command codes. The command frames must always contain 8 data bytes. Notes on the syntax and further command codes can be found in (1).

| Command                                      | Number of data bytes | Command code |
|--|----------------------|--------------|
| Write Request<br>(Initiate Domain Download)  | 1                    | 0x2F         |
|  | 2                    | 0x2B         |
|  | 3                    | 0x27         |
|  | 4                    | 0x23         |
| Write Response<br>(Initiate Domain Download) | -                    | 0x60         |
| Read Request<br>(Initiate Domain Upload)     | -                    | 0x40         |
| Read Response<br>(Initiate Domain Upload)    | 1                    | 0x4F         |
|  | 2                    | 0x4B         |
|  | 3                    | 0x47         |
|  | 4                    | 0x43         |
| Error Response<br>(Abort Domain Transfer)    | -                    | 0x80         |

**Index, Sub-Index**

Index and sub-index will be described in the chapters "Device Profile Area" and "Manufacturer Specific Objects" of this manual.

**Data Field**

The Data Field has got a size of a maximum of 4 bytes and is always structured 'LSB first, MSB last'. The least significant byte is always in 'Data 1'. With 16-bit values the most significant byte (bits 8...15) is always in 'Data 2', and with 32-bit values the MSB (bits 24...31) is always in 'Data 4'.

### Error Codes of the SDO Domain Transfer

The following error codes might occur (according to (1)):

| Abort code | Description   |
|------------|---|
| 0x05040001 | Wrong command specifier   |
| 0x06010002 | Wrong write access  |
| 0x06020000 | Wrong index   |
| 0x06040041 | Object cannot be mapped to PDO  |
| 0x06060000 | Access failed due to a hardware error   |
| 0x06070010 | Wrong number of data bytes  |
| 0x06070012 | Service parameter too long  |
| 0x06070013 | Service parameter too small   |
| 0x06090011 | Wrong sub-index   |
| 0x06090030 | Transmitted parameter is outside the accepted value range                                   |
| 0x08000000 | Undefined cause of error  |
| 0x08000020 | Data cannot be transferred or stored in the application                                     |
| 0x08000022 | Data cannot be transferred or stored in the application because of the present device state |
| 0x08000024 | Access to flash failed  |

## 4.5 Overview of used CANopen-Identifiers

| Function           | Identifier             | Description                                   |
|--------------------|------------------------|---|
| Network management | 0                      | NMT   |
| SYNC               | 0x80                   | Sync to all, (configurable via object 0x1005) |
| Emergency Message  | 0x80 + <i>NodeID</i>   | configurable via object 0x1014                |
| RPDO1              | 0x200 + <i>NodeID</i>  | PDO1 to CAN-CBX-REL4/2 (Rx) (object 0x1400)   |
| RPDO2              | 0x300 + <i>NodeID</i>  | PDO2 to CAN-CBX-REL4/2 (Rx) (object 0x1401)   |
| RPDO3              | 0x400 + <i>NodeID</i>  | PDO3 to CAN-CBX-REL4/2 (Rx) (object 0x1402)   |
| RPDO4              | 0x500 + <i>NodeID</i>  | PDO4 to CAN-CBX-REL4/2 (Rx) (object 0x1403)   |
| Client-SDO         | 0x580 + <i>Node-ID</i> | SDO to CAN-CBX-REL4/2 (Tx)                    |
| Server-SDO         | 0x600 + <i>Node-ID</i> | SDO to CAN-CBX-REL4/2 (Rx)                    |
| Node Guarding      | 0x700 + <i>NodeID</i>  | Readable via object 0x100E                    |

*NodeID*: CANopen address [0x01...0x7F]

### Setting the COB-ID

The COB-IDs which can be set (except the one of SYNC), are deduced initially from the setting of the Node-ID via the coding switches (see page 18). If the COB-IDs are set via SDO, this setting is valid even if the coding switches are set to another Node-ID after that.

To accept the Node-ID from the coding switches again, the *Comm defaults* or all defaults must be restored (object 0x1011).

## 4.6 Default PDO-Assignment

PDOs (Process Data Objects) are used to transmit process data. The PDO mapping can be changed. The following tables show the default mapping at delivery of the module:

| PDO   | CAN identifier  | Length | Transmission direction           | Assignment   |
|-------|-----------------|--------|----------------------------------|--|
| RPDO1 | 0x200 + Node-ID | 1 byte | To CAN-CBX-REL4/2 (Receive-PDO1) | Setting of the relays  |
| RPDO2 | 0x300 + Node-ID | 1 byte | To CAN-CBX-REL4/2 (Receive-PDO2) | For PDOs 2-4 there are no objects mapped in default setting. |
| RPDO3 | 0x400 + Node-ID | 1 byte | To CAN-CBX-REL4/2 (Receive-PDO3) |  |
| RPDO4 | 0x500 + Node-ID | 1 byte | To CAN-CBX-REL4/2 (Receive-PDO4) |  |

### RPDO1 (-> CAN-CBX-REL4)

CAN Identifier: 0x200 + Node-ID

| Byte      | 0                         | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|-----------|---------------------------|---|---|---|---|---|---|---|
| Parameter | <i>Write_Output_8-Bit</i> | - | - | - | - | - | - | - |

#### Parameter description:

| Parameter                 | Description           | Data type | See page |
|---------------------------|-----------------------|-----------|----------|
| <i>Write_Output_8-Bit</i> | Setting of the relays | Byte      | 68       |

## 4.7 Setting the Relays

The relays will be energized as soon as an output setting object is received by the CAN-CBX-REL4/2 (e.g. object 0x6200 via RPDO).

### 4.7.1 Supported Transmission Types Based on CiA 301

Transmission type *Synchronous* means that the CANopen device shall update the received data with the reception of the next SYNC.

Transmission type *Event-driven* means that the PDO may be received at any time. The CANopen device will update the data immediately.

## 4.8 Communication Profile Area

### 4.8.1 Used Names and Abbreviations

The following names are used in the tables for the description of the communication parameters:

|                  |  |
|------------------|--|
| PDO-Mappable     | PDO-Mapping is possible for this sub-index of the PDO  |
| Save to EEPROM   | The value of this parameter is stored in the local EEPROM, if the command 'save' is called (see object 0x1010)   |
| Data type        | Data type (e.g. unsigned 8, unsigned 32)   |
| Access mode      | Allowed access modes to this parameter<br>ro... read_only<br>This parameter can only be read.<br>Write accesses will cause an error message.<br>rw... read&write<br>This parameter can be read or written. |
| Value range      | Value range of the parameter   |
| Default value    | Default setting of the parameter   |
| Name/Description | Name and short description of the parameter  |

## 4.9 Implemented CANopen Objects

A detailed description of the Implemented CANopen Objects can be taken from CiA 301.

### 4.9.1 Overview Communication Profile Objects / Product-Specific Values

| Index  | Highest usable Sub-index | Description                   | Data type      | Access mode | Product-specific properties   |
|--------|--------------------------|-------------------------------|----------------|-------------|---|
| 0x1000 | 0x0                      | Device Type                   | unsigned 32    | ro          | Value of device type: 0x00020191  |
| 0x1001 | 0x0                      | Error Register                | unsigned 8     | ro          | Supported error bits:<br>0: generic<br>4: communication error   |
| 0x1003 | 0xA                      | Pre-Defined-Error-Field       | unsigned 32    | rw          | 0x00  |
| 0x1005 | 0x0                      | COB-ID-Sync                   | unsigned 32    | rw          | 0x80  |
| 0x1006 | 0x0                      | Communication Cycle Period    | unsigned 32    | rw          | 0x00  |
| 0x1008 | 0x0                      | Manufacturer Device Name      | visible string | ro          | "CAN-CBX-REL4/2"  |
| 0x1009 | 0x0                      | Manufacturer Hardware Version | visible string | ro          | x.yy<br>(depending on version)  |
| 0x100A | 0x0                      | Manufacturer Software Version | visible string | ro          | x.yy<br>(depending on version)  |
| 0x100B | 0x0                      | Node-ID                       | unsigned 32    | ro          | -   |
| 0x100C | 0x0                      | Guard Time                    | unsigned 16    | rw          | 0x0000  |
| 0x100D | 0x0                      | Life Time Factor              | unsigned 8     | rw          | 0x00  |
| 0x100E | 0x0                      | Node Guarding Identifier      | unsigned 32    | ro          | Node-ID + 0x700   |
| 0x1010 | 0x4                      | Store Parameter               | unsigned 32    | rw          | Parameters which can be saved or restored:<br>0x1005 ... 0x1029, see Objects of the Device Profile Area, page 66            |
| 0x1011 | 0x4                      | Restore Parameter             | unsigned 32    | rw          |   |
| 0x1014 | 0x0                      | COB-ID Emergency Object       | unsigned 32    | rw          | 0x80 + Node-ID  |
| 0x1015 | 0x0                      | Inhibit Time EMCY             | unsigned 16    | rw          | 0x00  |
| 0x1016 | 0x1                      | Consumer Heartbeat Time       | unsigned 32    | rw          | 0x00  |
| 0x1017 | 0x0                      | Producer Heartbeat Time       | unsigned 16    | rw          | 0x00  |

| 0x1019 | 0x0                      | Synchronous Counter Overflow  | unsigned 8     | rw          | 0x00  |
| 0x1020 | 0x2                      | Verify Configuration          | unsigned 32    | rw          | Configuration date and time   |
| 0x1029 | 0x1                      | Error Behaviour               | unsigned 8     | rw          | Supported error classes: 1,<br>Communication error only   |

| Index  | Highest usable Sub-index | Description              | Data type          |
|--------|--------------------------|--------------------------|--------------------|
| 0x1400 | 0x2                      | 1. Receive PDO-Parameter | PDO CommPar (0x20) |
| 0x1401 | 0x2                      | 2. Receive PDO-Parameter | PDO CommPar (0x20) |
| 0x1402 | 0x2                      | 3. Receive PDO-Parameter | PDO CommPar (0x20) |
| 0x1403 | 0x2                      | 4. Receive PDO-Parameter | PDO CommPar (0x20) |
| 0x1600 | 0x20                     | 1. Receive PDO-Mapping   | PDO Mapping (0x21) |
| 0x1601 | 0x20                     | 2. Receive PDO-Mapping   | PDO Mapping (0x21) |
| 0x1602 | 0x20                     | 3. Receive PDO-Mapping   | PDO Mapping (0x21) |
| 0x1603 | 0x20                     | 4. Receive PDO-Mapping   | PDO Mapping (0x21) |

| Index  | Highest usable Sub-index | Description                           | Data type   | Access mode | Product-specific properties        |
|--------|--------------------------|---------------------------------------|-------------|-------------|------------------------------------|
| 0x1F80 | 0x0                      | NMT startup                           | unsigned 32 | rw          | default: 2<br>(autostart disabled) |
| 0x1F91 | 0x1                      | Self-starting nodes timing parameters | unsigned 16 | rw          | default: 0x64<br>(= 100 ms)        |

## 4.9.2 Device Type (0x1000)

|               |  |
|---------------|--|
| <b>INDEX</b>  | <b>0x1000</b>  |
| Name          | <i>device type</i>   |
| Data type     | unsigned 32  |
| Access mode   | ro   |
| Default value | see chapter 'Overview Communication Profile Objects/<br>Product-Specific Values' (page 33) |

### Example: Reading the Device Type

The CANopen manager transmits the read request with identifier '0x603' (0x600 + Node-ID) to the CAN-CBX module with the module no. 3 (Node-ID=0x3):

| ID    | RTR | LEN | DATA                    |                      |      |                       |      |      |      |      |      |
|-------|-----|-----|-------------------------|----------------------|------|-----------------------|------|------|------|------|------|
|       |     |     | 1                       | 2                    | 3    | 4                     | 5    | 6    | 7    | 8    |      |
| 0x603 | 0x0 | 0x8 | 0x40<br>Read<br>Request | 0x00<br>Index=0x1000 | 0x10 | 0x00<br>Sub-<br>Index | 0x00 | 0x00 | 0x00 | 0x00 | 0x00 |

The CAN-CBX module no. 3 responds to the client by means of read response with identifier '0x583' (0x580 + Node-ID) with the value of the device type:

| ID    | RTR | LEN                     | DATA |                      |      |                      |   |      |  |      |
|-------|-----|-------------------------|------|----------------------|------|----------------------|---|------|--|------|
|       |     |                         | 1    | 2                    | 3    | 4                    | 5   | 6    | 7  | 8    |
| 0x583 | 0x0 | 0x8<br>Read<br>Response | 0x43 | 0x00<br>Index=0x1000 | 0x10 | 0x00<br>Sub<br>Index | 0x94<br>Example here:<br>Device Profile No.<br>0x0194 | 0x01 | 0x02<br>Example here:<br>Input<br>0x0002 | 0x00 |

Value of the device type in the example above: 0x00020194.

The value of the device type of the CAN-CBX-REL4/2 module is printed in chapter 'Overview Communication Profile Objects / Product-Specific Values' (page 33).

The data field is always structured following the rule: 'LSB first, MSB last', see **Data Field** page 29.

### 4.9.3 Error Register (0x1001)

The CAN-CBX module uses the error register to indicate error messages.

| INDEX         | 0x1001                |
|---------------|-----------------------|
| Name          | <i>error register</i> |
| Data type     | unsigned 8            |
| Access mode   | ro                    |
| Default value | 0                     |

Structure of the error register as defined in CiA 301:

| Bit | Meaning   |
|-----|---|
| 0   | <i>generic error</i>                              |
| 1   | <i>current</i>                                    |
| 2   | <i>voltage</i>                                    |
| 3   | <i>temperature</i>                                |
| 4   | <i>communication error (overrun, error state)</i> |
| 5   | <i>device profile specific</i>                    |
| 6   | reserved  |
| 7   | <i>manufacturer-specific</i>                      |

For a list of the error bits supported by the CAN-CBX-REL4/2 module see in chapter 'Overview Communication Profile Objects / Product-Specific Values' (page 33).

Bits which are not supported are always returned as '0'.  
If an error is active, the according bit is set to '1'.

#### 4.9.4 Pre-defined Error Field (0x1003)

|               |                                |
|---------------|--------------------------------|
| <b>INDEX</b>  | <b>0x1003</b>                  |
| Name          | <i>pre-defined error field</i> |
| Data type     | unsigned 32                    |
| Access mode   | ro                             |
| Default value | No                             |

The *pre-defined error field* provides an error history of the errors that have occurred on the device and have been signalled via the Emergency Object.

Sub-index 0 contains the current number of errors stored in the list.

Under sub-index 1 the last error which occurred is stored.

If a new error occurs, the previous error is stored under sub-index 2 and the new error under sub-index 1, etc. In this way a list of the error history is created.

The error buffer is structured like a ring buffer. If it is full, the oldest entry is deleted for the latest entry.

This module supports a maximum of 10 error entries. When the 11th error occurs the oldest error entry is deleted. To delete the entire error list, sub-index 0 has to be set to '0'. This is the only permissible write access to the object.

With every new entry to the list the module transmits an **Emergency Frame** to report the error.

| Index         | Sub-index | Description                 | Value range       | Default | Data type   | Access mode |
|---------------|-----------|-----------------------------|-------------------|---------|-------------|-------------|
| <b>0x1003</b> | 0         | <i>no_of_errors_in_list</i> | 0, 1, ... 0xA     | -       | unsigned 8  | rw          |
|               | 1         | <i>error-code n</i>         | 0 ... 0xFFFF FFFF | 0       | unsigned 32 | ro          |
|               | 2         | <i>error-code (n-1)</i>     | 0 ... 0xFFFF FFFF | 0       | unsigned 32 | ro          |
|               | :         | :                           | :                 | :       | :           | :           |
|               | 0xA       | <i>error-code (n-9)</i>     | 0 ... 0xFFFF FFFF | 0       | unsigned 32 | ro          |

Meaning of the variables:

- no\_of\_errors\_in\_list*** - contains the number of error codes currently on the list.  
*n* = number of the error, which occurred last.
- To delete the error list, this variable has to be set to '0'.
  - If *no\_of\_errors\_in\_list* ≠ 0, the error register (Object 0x1001) is set

***error-code x*** The 32-bit long error code consists of the CANopen-emergency error code described in (1) and the error code defined by esd (manufacturer-specific error field).

|                  |  |        |                             |       |
|------------------|--|--------|-----------------------------|-------|
| <b>Bit:</b>      | 31 ...                                   | ... 16 | 15 ...                      | ... 0 |
| <b>Contents:</b> | <i>manufacturer-specific error field</i> |        | <i>emergency-error-code</i> |       |

*manufacturer-specific error field:* Always '00', unless *emergency-error-code* = 0x2300 (see below)

*emergency-error-code:* The following error-codes are supported:

- 0x8210 EMERGENCY\_PDO\_NOT\_PROCESSED\_DUE\_TO\_LENGTH\_ERROR (=PDO too short)
- 0x8220 EMERGENCY\_PDO\_LENGTH\_EXCEEDED (=PDO too long)
- 0x5000 EMERGENCY\_DEVICE\_HARDWARE (e.g. EEPROM error)
- 0x8130 EMERGENCY\_LIFEGUARD\_ERROR (Lifeguard timeout)

### Emergency Message

The data of the emergency frame transmitted by the CAN-CBX-module have the following structure:

| Byte:     | 0  | 1 | 2                               | 3  | 4 | 5 | 6 | 7 |
|-----------|--|---|---------------------------------|--|---|---|---|---|
| Contents: | <i>emergency-error-code</i><br>(see above) |   | <i>error-register</i><br>0x1001 | <i>no_of_errors_in_list</i><br>0x1003,00 | - |   |   |   |

An emergency message is transmitted if an error occurs. If this error occurs again, no further emergency message is generated.

If the last error message is cancelled, again an emergency message is transmitted to indicate the error disappearance.

### 4.9.5 COB-ID of SYNC-Message (0x1005)

|               |  |
|---------------|--|
| <b>INDEX</b>  | <b>0x1005</b>  |
| Name          | <i>COB-ID SYNC message</i>   |
| Data type     | unsigned 32  |
| Access mode   | rw   |
| Default value | see chapter 'Overview Communication Profile Objects / Product-Specific Values' (page 33) |

Structure of the parameter:

| Bit-No.      | Value | Meaning  |
|--------------|-------|--|
| 31 (MSB)     | -     | do not care  |
| 30           | 0/1   | 0: Device does not generate SYNC message<br>1: Device generates SYNC message |
| 29           | 0     | always 0 (11-bit ID)   |
| 28...11      | 0     | always 0 (29-bit IDs are not supported)                                      |
| 10...0 (LSB) | x     | Bit 0...10 of the SYNC-COB-ID  |

The identifier can take values between 0...0x7FF.

## 4.9.6 Communication Cycle Period (0x1006)

|               |                                   |
|---------------|-----------------------------------|
| <b>INDEX</b>  | <b>0x1006</b>                     |
| Name          | <i>communication cycle period</i> |
| Data type     | unsigned 32                       |
| Access mode   | rw                                |
| Default value | 0 [ $\mu$ s]                      |

Value range of the parameter:

| Value                        | Meaning  |
|------------------------------|--|
| 0                            | No transmission of SYNC messages   |
| 0x00000001 ...<br>0xFFFFFFFF | Cycle time in microseconds,<br><br>Example:<br>0x4E20 corresponds to a cycle time of 20000 $\mu$ s = 20 ms |

### 4.9.7 Manufacturer Device Name (0x1008)

|               |  |
|---------------|--|
| <b>INDEX</b>  | <b>0x1008</b>  |
| Name          | <i>manufacturer device name</i>  |
| Data type     | visible string   |
| Default value | see chapter 'Overview Communication Profile Objects/<br>Product-Specific Values' (page 33) |

### 4.9.8 Manufacturer Hardware Version (0x1009)

|               |                                       |
|---------------|---------------------------------------|
| <b>INDEX</b>  | <b>0x1009</b>                         |
| Name          | <i>manufacturer hardware version</i>  |
| Data type     | visible string                        |
| Default value | String, depending on hardware version |

The hardware version is read similarly to reading the manufacturer's device name via the domain upload protocol.

### 4.9.9 Manufacturer Software Version (0x100A)

|               |                                       |
|---------------|---------------------------------------|
| <b>INDEX</b>  | <b>0x100A</b>                         |
| Name          | <i>manufacturer software version</i>  |
| Data type     | visible string                        |
| Default value | String, depending on software version |

Reading the software version is similar to reading the manufacturer's device name via the domain upload protocol.

### 4.9.10 Guard Time (0x100C) and Life Time Factor (0x100D)

The CAN-CBX-REL4/2 supports the node guarding or alternatively the heartbeat function (see page 51).

#### NOTICE

By the recommendation of the CiA, the heartbeat-function shall be used preferentially. Use the node-guarding only for existing systems and not for new developments!

*Guard time* and *life time factor* are evaluated together. Multiplying both values will give you the life time. The guard time is represented in milliseconds.

| INDEX         | 0x100C            |
|---------------|-------------------|
| Name          | <i>guard time</i> |
| Data type     | unsigned 16       |
| Access mode   | rw                |
| Default value | 0 [ms]            |
| Minimum value | 0                 |
| Maximum value | 0xFFFF (65.535 s) |

| INDEX         | 0x100D                  |
|---------------|-------------------------|
| Name          | <i>life time factor</i> |
| Data type     | unsigned 8              |
| Access mode   | rw                      |
| Default value | 0                       |
| Minimum value | 0                       |
| Maximum value | 0xFF                    |

### 4.9.11 Node Guarding Identifier (0x100E)

The module only supports 11-bit identifiers.

|               |                                 |
|---------------|---------------------------------|
| <b>INDEX</b>  | <b>0x100E</b>                   |
| Name          | <i>node guarding identifier</i> |
| Data type     | unsigned 32                     |
| Access mode   | ro                              |
| Default value | 0x700 + Node-ID                 |

Structure of the parameter *node guarding identifier*:

| Bit-No.        | Meaning   |
|----------------|---|
| 31 (MSB)<br>30 | reserved  |
| 29 ... 11      | always 0, because 29-bit-IDs are not supported      |
| 10 ... 0 (LSB) | bit 0 ... 10 of the <i>node guarding identifier</i> |

The identifier can take values between 0x701...0x7FF, depending on the Node-ID set by the coding switches.

## 4.9.12 Store Parameters (0x1010)

|              |                         |
|--------------|-------------------------|
| <b>INDEX</b> | <b>0x1010</b>           |
| Name         | <i>store parameters</i> |
| Data type    | unsigned 32             |

This object supports saving of parameters to a non-volatile memory, the EEPROM here. The parameter groups shown below are distinguished. After they are transferred, the parameters are immediately active. The non-volatile storage of the parameters however is not carried out automatically. It must be initiated with a write access to object 0x1010 and should only be carried out if the module is in the state *pre-operational*. To avoid storage of parameters by mistake, storage is only executed when the specific signature as shown below is transmitted.

Reading the index returns information about the implemented storage functionality (refer to (1) for more information).

| Index         | Sub-index | Description  | Value range   | Data type   | Access mode |
|---------------|-----------|--|---|-------------|-------------|
| <b>0x1010</b> | 0         | <i>number_of_entries</i>   | 4   | unsigned 8  | ro          |
|               | 1         | <i>save_all_parameters</i><br>(objects 0x1000 ... 0x9FFF)          | no default,<br>write:<br>0x65 76 61 73<br>(= ASCII: 'e' 'v' 'a' 's')<br>read: 1 | unsigned 32 | rw          |
|               | 2         | <i>save_communication_parameter</i><br>(objects 0x1000 ... 0x1FFF) |   | unsigned 32 | rw          |
|               | 3         | <i>save_application_parameter</i><br>(objects 0x6000 ... 0x9FFF)   |   | unsigned 32 | rw          |
|               | 4         | <i>save_manufacturer_parameter</i><br>(objects 0x2000 ... 0x5FFF)  |   | unsigned 32 | rw          |

### Assignment of the variables:

#### ***save\_all\_parameters***

Saves the parameters of all objects (if available), which have a read/write (rw) right of access.

#### ***save\_communication\_parameter***

Saves all communication parameters of those objects (objects 0x1000 ... 0x1FFF, if available), which have a read/write (rw) right of access (here e.g. 0x1005 ... 0x1029).

#### ***save\_application\_parameter***

Saves all application parameters of those objects (objects 0x6000 ... 0x9FFF, if available), which have a read/write (rw) right of access (here e.g. 0x6xxx).

#### ***save\_manufacturer\_parameter***

Saves all manufacturer parameters of those objects (objects 0x2000 ... 0x5FFF, if available), which have a read/write (rw) right of access (here e.g. 0x2xxx).

The storage mode is shown in the content of this object:

Bit 1 of object 0x1010, sub-index 1 is not set, i.e the CAN-CBX-module does not save the configuration automatically.

The storage must be initiated by writing the character string 'save' (0x73 61 76 65, order from CAN telegram) to object 0x1010, sub-index 1 - 4.

On read access to the appropriate sub-index, the CAN-CBX-REL4/2 provides information about its storage functionality with the format described in the following:

|                 |          |        |       |             |            |
|-----------------|----------|--------|-------|-------------|------------|
| <b>Bit:</b>     | 31       | 30 ... | ... 2 | 1           | 0          |
| <b>Content:</b> | reserved |        |       | <b>auto</b> | <b>cmd</b> |
|                 | 0        |        |       | 0           | 1          |
|                 | MSB      |        |       |             | LSB        |

| Bit         | Value | Description   |
|-------------|-------|---|
| <b>auto</b> | 0     | CAN-CBX module does <b>not</b> save the parameters autonomously |
|             | 1     | CAN-CBX module <b>saves</b> the parameters autonomously         |
| <b>cmd</b>  | 0     | CAN-CBX module does <b>not</b> save the parameters on command   |
|             | 1     | CAN-CBX module <b>saves</b> the parameters on command           |

Autonomous saving means that the CAN-CBX module stores the storable parameters non-volatile and without a user request.

### 4.9.13 Restore Default Parameters (0x1011)

|              |                                   |
|--------------|-----------------------------------|
| <b>INDEX</b> | <b>0x1011</b>                     |
| Name         | <i>restore default parameters</i> |
| Data type    | unsigned 32                       |

Via this command the default parameters, as valid when leaving the manufacturer, are restored. The parameter groups as described below are distinguished.

Every individual setting stored in the EEPROM will be lost.

After a reset the default parameters will be active. The reset of the parameters however must be initiated with a write access to object 0x1011. To write the index a specific signature as shown below must be transmitted.

Reading the index provides information about its parameter restoring capability (refer to (1) for more information).

| Index         | Sub-index | Description   | Value range   | Data type   | Access mode |
|---------------|-----------|---|---|-------------|-------------|
| <b>0x1011</b> | 0         | <i>number_of_entries</i>  | 4   | unsigned 8  | ro          |
|               | 1         | <i>restore_all_default_parameters</i><br>(objects 0x1000 ... 0x9FFF)  | no default,<br>write:<br>0x 64 61 6F 6C<br>(= ASCII: 'd' 'a' 'o' 'l'),<br>read: 1 | unsigned 32 | rw          |
|               | 2         | <i>restore_communication_parameter</i><br>(objects 0x1000 ... 0x1FFF) |   | unsigned 32 | rw          |
|               | 3         | <i>restore_application_parameter</i><br>(objects 0x6000 ... 0x9FFF)   |   | unsigned 32 | rw          |
|               | 4         | <i>restore_manufacturer_parameter</i><br>(objects 0x2000 ... 0x5FFF)  |   | unsigned 32 | rw          |

#### Assignment of the variables:

##### ***restore all parameters***

Restores the default parameters of all objects (if available), which have a read/write (rw) right of access.

##### ***restore\_communication\_parameter***

Restores all communication default parameters of those objects (objects 0x1000 ... 0x1FFF, if available, here e.g. 0x1005 ... 0x1029).

##### ***restore\_application\_parameter***

Restores all application default parameters of those objects (objects 0x6000 ... 0x9FFF, if available, here e.g. 0x6xxx).

##### ***restore\_manufacturer\_parameter***

Loads all manufacturer default parameters of those objects (objects 0x2000 ... 0x5FFF, if available, here e.g. 0x2xxx).

Bit 0 of object 0x1011, sub-index 1 is set, i.e. the CAN-CBX module restores the default values initiated by writing the signature 'load' (0x64 61 6F 6C, sequence in CAN telegram) in object 0x1011, sub-index 1-4.

On read access to the appropriate sub-index, the CANopen device provides information about its default parameter restoring capability with the following format:

|                 |          |        |       |            |
|-----------------|----------|--------|-------|------------|
| <b>Bit:</b>     | 31       | 30 ... | ... 1 | 0          |
| <b>Content:</b> | reserved |        |       | <b>cmd</b> |
|                 | 0        |        |       | 1          |
|                 | MSB      |        |       | LSB        |

| Bit        | Value | Description   |
|------------|-------|---|
| <b>cmd</b> | 0     | The CAN-CBX-module does <b>not</b> restore default parameters |
|            | 1     | The CAN-CBX-module <b>restores</b> the default parameters     |

#### 4.9.14 COB\_ID Emergency Message (0x1014)

|               |                                |
|---------------|--------------------------------|
| <b>INDEX</b>  | <b>0x1014</b>                  |
| Name          | <i>COB-ID emergency object</i> |
| Data type     | unsigned 32                    |
| Default value | 0x80 + Node-ID                 |

This object defines the COB-ID of the emergency object (EMCY).

The structure of this object is shown in the following table:

| Bit-No.        | Value | Meaning   |
|----------------|-------|---|
| 31 (MSB)       | 0/1   | 0: EMCY exists / is valid<br>1: EMCY does not exist / EMCY is not valid |
| 30             | 0     | reserved (always 0)   |
| 29             | 0     | always 0 (11-bit ID)  |
| 28...11        | 0     | always 0 (29-bit IDs are not supported)                                 |
| 10 ... 0 (LSB) | x     | bits 0...10 of COB-ID   |

The identifier can take values between 0x000...0x7FF.

#### 4.9.15 Inhibit Time EMCY (0x1015)

|               |                               |
|---------------|-------------------------------|
| <b>INDEX</b>  | <b>0x1015</b>                 |
| Name          | <i>inhibit_time_emergency</i> |
| Data type     | unsigned 16                   |
| Access mode   | rw                            |
| Value range   | 0 ... 0xFFFF                  |
| Default value | 0                             |

The *Inhibit Time* for the EMCY message can be defined with this entry. The time is determined as a multiple of 100  $\mu$ s.

### 4.9.16 Consumer Heartbeat Time (0x1016)

|               |                                |
|---------------|--------------------------------|
| <b>INDEX</b>  | <b>0x1016</b>                  |
| Name          | <i>consumer heartbeat time</i> |
| Data type     | unsigned 32                    |
| Default value | 0                              |

The heartbeat function can be used for mutual monitoring of the CANopen modules (especially to detect connection failures). Unlike node guarding/life guarding the heartbeat function does not require RTR-Frames.

**Function:**

A module, the so-called heartbeat producer, cyclically transmits a heartbeat message on the CAN-bus on the node-guarding identifier (see object 0x100E). One or more heartbeat consumers receive the message. The message must be received within the heartbeat time stored on the heartbeat consumer, otherwise a heartbeat event is triggered on the heartbeat-consumer module. A heartbeat event generates a heartbeat error on the CAN-CBX module.

Each module can act as a heartbeat producer and a heartbeat consumer. The CAN-CBX module can represent at most one heartbeat consumer per CAN net.

| Index  | Sub-index | Description                    | Value range        | Default | Data type   | Access mode |
|--------|-----------|--------------------------------|--------------------|---------|-------------|-------------|
| 0x1016 | 0         | <i>number_of_entries</i>       | 1                  | 1       | unsigned 8  | ro          |
|        | 1         | <i>consumer_heartbeat_time</i> | 0 ... 0x007FFFFFFF | 0       | unsigned 32 | rw          |

**Meaning of the variable *consumer-heartbeat\_time\_x*:**

|            |                          | <i>consumer-heartbeat_time_x</i> |                                |        |  |       |
|------------|--------------------------|----------------------------------|--------------------------------|--------|--|-------|
| Bit        | 31 ...                   | ... 24                           | 23 ...                         | ... 16 | 15 ...                                 | ... 0 |
| Assignment | reserved<br>(always '0') |                                  | <i>Node-ID</i><br>(unsigned 8) |        | <i>heartbeat_time</i><br>(unsigned 16) |       |

**Node-ID** Node-Id of the heartbeat producer to be monitored.

**heartbeat\_time** Within this time [ms] the heartbeat producer must transmit the heartbeat on the node-guarding ID, to avoid the transmission of a heartbeat event.  
The consumer-heartbeat time of the monitoring module must always be higher than the producer-heartbeat time of the heartbeat-transmitting module.

**Example:**

*consumer-heartbeat\_time* = 0x0031 03E8

=> *Node-ID* = 0x31 = 49 (decimal)  
=> *heartbeat time* = 0x3E8 = 1000 (decimal) => 1 s

### 4.9.17 Producer Heartbeat Time (0x1017)

|               |                                |
|---------------|--------------------------------|
| <b>INDEX</b>  | <b>0x1017</b>                  |
| Name          | <i>producer heartbeat time</i> |
| Data type     | unsigned 16                    |
| Default value | 0 [ms]                         |

The producer heartbeat time defines the cycle time with which the CAN-CBX- module transmits a heartbeat-frame to the node-guarding ID.

If the value of the producer heartbeat time is higher than '0', it is active and stops the node-/ life-guarding (see 4.9.10 page 42).

If the value of the producer-heartbeat-time is set to '0', transmitting heartbeats by this module is stopped.

| Index         | Sub-index | Description                    | Value range  | Default | Data type   | Access mode |
|---------------|-----------|--------------------------------|--------------|---------|-------------|-------------|
| <b>0x1017</b> | 0         | <i>producer-heartbeat_time</i> | 0 ... 0xFFFF | 0       | unsigned 16 | rw          |

***producer-heartbeat\_time*** Cycle time [ms] of heartbeat producer to transmit the heartbeat on the node-guarding ID (see object 0x100E).  
The consumer-heartbeat time of the monitoring module must always be higher than the producer-heartbeat time of the heartbeat-transmitting module.

## 4.9.18 Identity Object (0x1018)

|               |                        |
|---------------|------------------------|
| <b>INDEX</b>  | <b>0x1018</b>          |
| Name          | <i>identity object</i> |
| Data type     | unsigned 32            |
| Default value | see below              |

This object contains general information to the CAN module.

| Index         | Sub-index | Description              | Value range      | Default                                  | Data type   | Access mode |
|---------------|-----------|--------------------------|------------------|--|-------------|-------------|
| <b>0x1018</b> | 0         | <i>number_of_entries</i> | 4                | 4  | unsigned 8  | ro          |
|               | 1         | <i>vendor_id</i>         | 0 ... 0xFFFFFFFF | 0x00000017                               | unsigned 32 | ro          |
|               | 2         | <i>product_code</i>      | 0 ... 0xFFFFFFFF | (see page 33 for product specific value) | unsigned 32 | ro          |
|               | 3         | <i>revision_number</i>   | 0 ... 0xFFFFFFFF | 0x10                                     | unsigned 32 | ro          |
|               | 4         | <i>serial_number</i>     | 0 ... 0xFFFFFFFF | -  | unsigned 32 | ro          |

**Description of the variables:**

***vendor\_id*** This variable contains the esd-vendor-ID. This is always 0x00000017.

***product\_code*** Here the esd-article number of the product is stored.  
The nibbles of the long words have the following meaning:

*product\_code* = 0xabcd efgh

- a***: 1... article number beginning with character "K"  
2....article number beginning with character "C"
- bcde***: 4-digit hex number, which is interpreted as the integer part of the decimal number (on the left of the decimal point).
- f***: currently not evaluated
- gh***: 2-digit hex number, which is interpreted as the fraction part of the decimal number (on the right of the decimal point).

Example: '0x2301 0004' corresponds to article number 'C.3010.04' (CAN-CBX-DIO8/2).

***revision\_number*** Here the software version is stored. In accordance with (1) the two MSB represent the revision numbers of the major changes and the two LSB show the revision number of minor corrections or changes.

|                          |        |                          |       |
|--------------------------|--------|--------------------------|-------|
| <i>revision_no</i>       |        |                          |       |
| <i>major_revision_no</i> |        | <i>minor_revision_no</i> |       |
| 31 ...                   | ... 16 | 15 ...                   | ... 0 |
| MSB                      |        | LSB                      |       |

***serial\_number*** Here the serial number of the hardware is read. The first two characters of the serial number are letters which designate the manufacturing lot.

The following characters represent the actual serial number.

In the two MSB of *serial\_no* the letters of the manufacturing lot are coded. They each contain the ASCII-code of the letter with the MSB set '1' in order to be able to differentiate between letters and numbers:

(ASCII-Code) + 0x80 = read\_byte

The two last significant bytes contain the number of the module as BCD-value.

Example:

If the value '0xC1C2 0105' is being read, this corresponds to the hardware-serial number code 'AB 0105'. This value must correspond to the serial number of the module.

See chapter 'Overview Communication Profile Objects / Product-Specific Values' on page 33 for the article number and the serial number of your module.

#### 4.9.19 Synchronous Counter Overflow Value (0x1019)

|               |                                     |
|---------------|-------------------------------------|
| <b>INDEX</b>  | <b>0x1019</b>                       |
| Name          | <i>synchronous_counter_overflow</i> |
| Data type     | unsigned 8                          |
| Default value | 0                                   |

This object defines whether a counter is mapped into the SYNC message or not and further the highest value the counter can reach.

The value range of the object is described in the following table:

| <b>Value</b> | <b>Description</b>  |
|--------------|---|
| 0            | The SYNC message shall be transmitted as a CAN message of data length '0'.  |
| 1            | reserved  |
| 2...240      | The SYNC message shall be transmitted as a CAN message of data length '1'.<br>The first data byte contains the counter. |
| 241...255    | reserved  |

## 4.9.20 Verify Configuration (0x1020)

|               |                             |
|---------------|-----------------------------|
| <b>INDEX</b>  | <b>0x1020</b>               |
| Name          | <i>verify configuration</i> |
| Data type     | unsigned 32                 |
| Default value | see below                   |

In this object the date and the time of the last configuration can be stored to check later whether the configuration complies with the expected configuration or not.

The content of the parameters is not evaluated by the firmware.

| Index         | Sub-index | Description               | Value range      | Default | Data type   | Access mode |
|---------------|-----------|---------------------------|------------------|---------|-------------|-------------|
| <b>0x1020</b> | 0         | <i>no_of_entries</i>      | 2                | 2       | unsigned 8  | ro          |
|               | 1         | <i>configuration_date</i> | 0 ... 0xFFFFFFFF | 0       | unsigned 32 | rw          |
|               | 2         | <i>configuration_time</i> | 0 ... 0xFFFFFFFF | 0       | unsigned 32 | rw          |

### Parameter Description:

***configuration\_date*** Date of the last configuration of the module. The value is defined in number of days since the 01.01.1984.

***configuration\_time*** Time in ms since midnight at the day of the last configuration.

### 4.9.21 Error Behaviour Object (0x1029)

|               |                               |
|---------------|-------------------------------|
| <b>INDEX</b>  | <b>0x1029</b>                 |
| Name          | <i>error behaviour object</i> |
| Data type     | unsigned 8                    |
| Default value | see below                     |

If an error event occurs (such as heartbeat error), the module changes into the status which has been defined in variable *communication\_error* or *output\_error*.

| Index  | Sub-index | Description                | Value range | Default | Data type  | Access mode |
|--------|-----------|----------------------------|-------------|---------|------------|-------------|
| 0x1029 | 0         | <i>no_of_error_classes</i> | 1           | 1       | unsigned 8 | ro          |
|        | 1         | <i>communication_error</i> | 0..2        | 0       | unsigned 8 | rw          |

#### Meaning of the variables:

| Variable                   | Meaning                                      |
|----------------------------|--|
| <i>no_of_error_classes</i> | number of error-classes (here always '1')    |
| <i>communication_error</i> | heartbeat/lifeguard error and <i>Bus off</i> |

The module can enter the following states if an error occurs.

| Variable | Module state   |
|----------|--|
| 0        | pre-operational (only if the current state is operational) |
| 1        | no state change  |
| 2        | stopped  |

## 4.9.22 Receive PDO Communication Parameter (0x1400 – 0x1403)

These objects define the parameters of receive PDOs (RPDOs).

|              |                              |
|--------------|------------------------------|
| <b>INDEX</b> | <b>0x1400 - 0x1403</b>       |
| Name         | <i>receive PDO parameter</i> |
| Data Type    | PDOCommPar                   |

| Index         | Sub-index | Description                 | Value range                    | Default                  | Data type   | Access |
|---------------|-----------|-----------------------------|--------------------------------|--------------------------|-------------|--------|
| <b>0x1400</b> | 0         | <i>no_of_entries</i>        | 2                              | 2                        | unsigned 8  | ro     |
|               | 1         | <i>COB_ID used by RPDO1</i> | 0x0000 0001 ...<br>0x0000 07FF | 0x0000 0200<br>+ Node-ID | unsigned 32 | rw     |
|               | 2         | <i>transmission type</i>    | 0x00 ... 0xFF                  | 0xFF                     | unsigned 8  | rw     |
| <b>0x1401</b> | 0         | <i>no_of_entries</i>        | 2                              | 2                        | unsigned 8  | ro     |
|               | 1         | <i>COB_ID used by RPDO2</i> | 0x0000 0001 ...<br>0x8000 07FF | 0x8000 0300<br>+ Node-ID | unsigned 32 | rw     |
|               | 2         | <i>transmission type</i>    | 0x00 ... 0xFF                  | 0xFF                     | unsigned 8  | rw     |
| <b>0x1402</b> | 0         | <i>no_of_entries</i>        | 2                              | 2                        | unsigned 8  | ro     |
|               | 1         | <i>COB_ID used by RPDO3</i> | 0x0000 0001 ...<br>0x8000 07FF | 0x8000 0400<br>+ Node-ID | unsigned 32 | rw     |
|               | 2         | <i>transmission type</i>    | 0x00 ... 0xFF                  | 0xFF                     | unsigned 8  | rw     |
| <b>0x1403</b> | 0         | <i>no_of_entries</i>        | 2                              | 2                        | unsigned 8  | ro     |
|               | 1         | <i>COB_ID used by RPDO4</i> | 0x0000 0001 ...<br>0x8000 07FF | 0x8000 0500<br>+ Node-ID | unsigned 32 | rw     |

All *transmission types* are supported.

### 4.9.23 Receive PDO Mapping Parameter (0x1600 – 0x1603)

These objects define the assignment of the receive data to RPDOs.

| INDEX     | 0x1600 - 0x1603            |
|-----------|----------------------------|
| Name      | <i>receive PDO mapping</i> |
| Data Type | PDO Mapping                |

The following table shows the assignment of the Receive PDO Mapping parameters for the default-configuration:

| Index         | Sub-index | Description                                     | Value range                                | Default     | Data type   | Access |
|---------------|-----------|---|--|-------------|-------------|--------|
| <b>0x1600</b> | 0         | <i>no_of_mapped_application_objects_in_PDO1</i> | 0x00 ... 0x20                              | 1           | unsigned 8  | rw     |
|               | 1         | <i>1<sup>st</sup>_application_object_PDO1</i>   | For objects, that can be mapped see below. | 0x6200 0108 | unsigned 32 | rw     |
|               | 2         | <i>2<sup>nd</sup>_application_object_PDO1</i>   |  | 0x0000 0000 | unsigned 32 | rw     |
|               | :         | :   |  | :           | :           | :      |
|               | 0x1F      | <i>31<sup>th</sup>_application_object_PDO1</i>  |  | 0x0000 0000 | unsigned 32 | rw     |

Table 9: Mappable default types

### 4.9.23.1 Synchronous Setting of the Relays of 8 CAN-CBX-REL4/2-Modules

In general, it is possible to access several CAN-CBX modules synchronously. The CAN-CBX-REL4/2 modules can be configured so, that up to 8 CAN-CBX-REL4/2 modules can be addressed (object 0x6200) with a single CAN frame simultaneously. Therefore all 32 relays can be set simultaneously. The Receive COB-IDs of the CAN-CBX-REL4/2 modules must be set to the same value using object 0x1400.

The mapping has to be defined in object 0x1600.

Sub-index 0x0 contains the number of valid entries within the mapping record (see following table). The number of mapped bits and thus the byte-length of the PDO CAN frame shall be the same for all modules processing this PDO.

| Value | Description                      |
|-------|----------------------------------|
| 0x00  | Mapping disabled                 |
| 0x01  | Sub-index 0x01 valid             |
| 0x02  | Sub-index 0x01 and 0x02 valid    |
| 0x03  | Sub-index from 0x01 - 0x03 valid |
| :     | :                                |
| 0x08  | Sub-index from 0x01 – 0x08 valid |

Sub-indices from 0x01 to 0x08 contain the information of the mapped application objects. The entry describes the content of the PDO by their index, sub-index, and length.

For the CAN-CBX-REL4/2 module, the value 0x6200 0108 (index 0x6200, sub-index 0x01 and length 0x08) may only be contained once. The other sub-indices contain the value 0x0005 0008 as placeholder for the so-called dummy mapping.

#### NOTICE

Mapping with bit-objects (object 0x6220) enables the parallel control of up to 16 CAN-CBX-REL4/2 modules via one CAN-Frame (PDO).

#### Example:

There are three CAN-CBX-REL4/2 modules which shall be addressed via RPDO-Mapping simultaneously.

Therefore, the RPDO COB-IDs of the modules have to be configured to the same value. For further information refer to CiA 301.

The object 0x1600 must be configured differently for the three modules.

For the first module the *application\_object* has to be contained in sub-index 0x01, for the second module in sub-index 0x02 and for the third module in sub-index 0x03 (see Figure 12). For a higher number of modules (here up to 8 modules) the entries have to be continued respectively.

In the preceding or following sub-indices (here sub-index 0x01 and 0x02) which are not used, the value 0x0005 0008 has to be entered for the dummy-mapping. Sub-index 0x00 contains the number of sub-indices, according to the number of the valid objects.

Entry in object 0x1600 for **module 3**:

| Index         | Sub-index | Description                                    | Value              |
|---------------|-----------|--|--------------------|
| <b>0x1600</b> | 0         | <i>no_of_mapped_application_objects_in_PDO</i> | 0x03               |
|               | 1         | <i>1<sup>st</sup>_application_object</i>       | 0x0005 0008        |
|               | 2         | <i>2<sup>nd</sup>_application_object</i>       | 0x0005 0008        |
|               | 3         | <i>3<sup>rd</sup>_application_object</i>       | <b>0x6200 0108</b> |

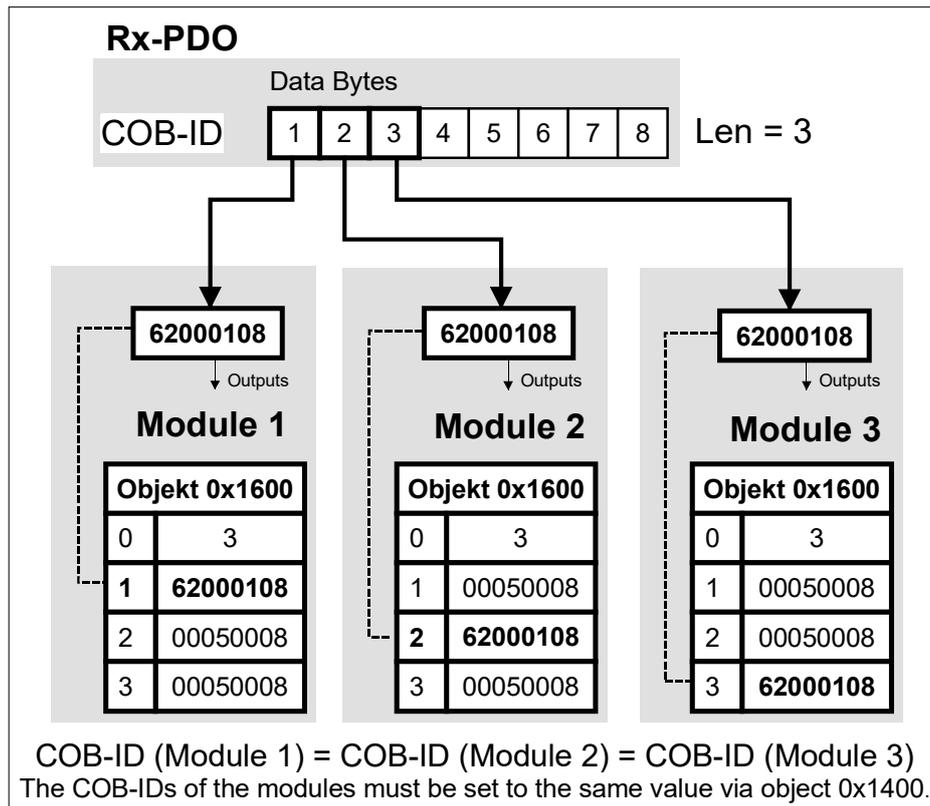

Figure 12: Example for the RPDO mapping with three CAN-CBX-REL4/2 modules

### 4.9.23.2 Switching the four Relays of a Module with Mapping of Bit-Objects

Via the objects 0x1600 to 0x1603 the four relays of the CAN-CBX-REL4/2 can be switched by mapping of bit-objects with one PDO.

In the example below, the relays are switched with the bits 4 - 7 of the first data byte of the RPDO. Sub-index 0x05 to 0x08 of object 0x1600 contain the object 0x6220, and the sub-index, which contains the number of the relay that shall be switched.

The sub-indices 0x01 to 0x04 of the object 0x1600 contain the value 0x0001 0001 as placeholder for the so-called dummy mapping, because the data byte must always be 1 byte long.

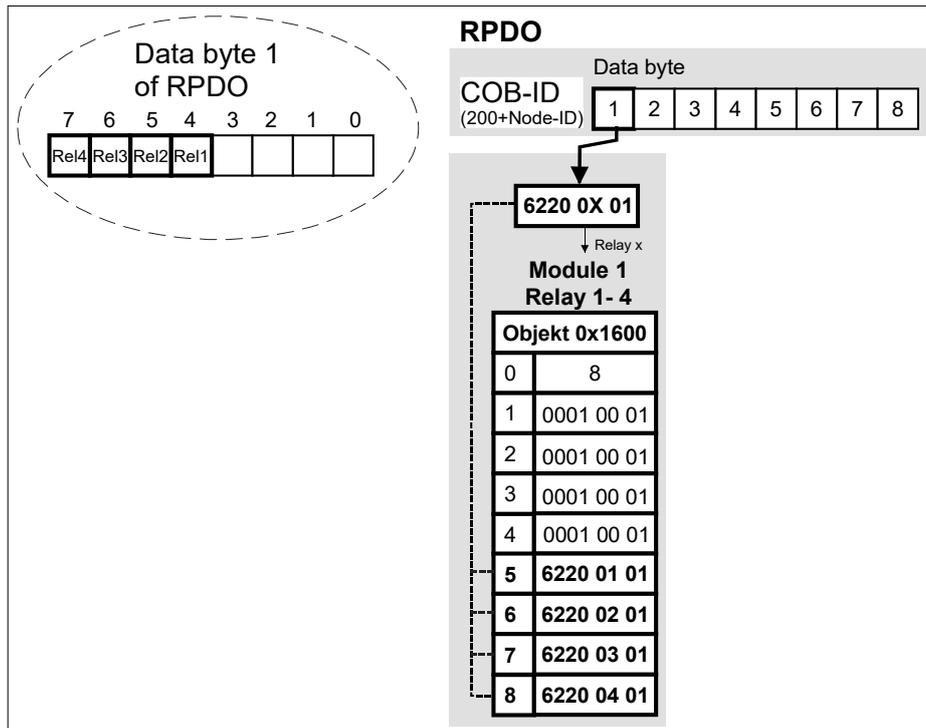

Figure 13: Example PDO mapping of bit objects

### 4.9.23.3 Switching the four relays of a module with different PDOs

With the objects from 0x1600 to 0x1603 the four relays of the CAN-CBX-REL4/2 can be independently switched by individual PDOs.

In the example below the relays are switched by bit 0 of the first data byte of the corresponding RPDOs.

Sub-index 0x01 of the objects 0x1600 to 0x1603 contains the object 0x6220, and the sub-index, which contains the number of the relay that shall be switched.

The sub-indices 0x02 to 0x08 of the objects 0x1600 to 0x1603 contain the value 0x0001 0001 as placeholder for the so-called dummy mapping, because the data byte must always be 1 byte long.

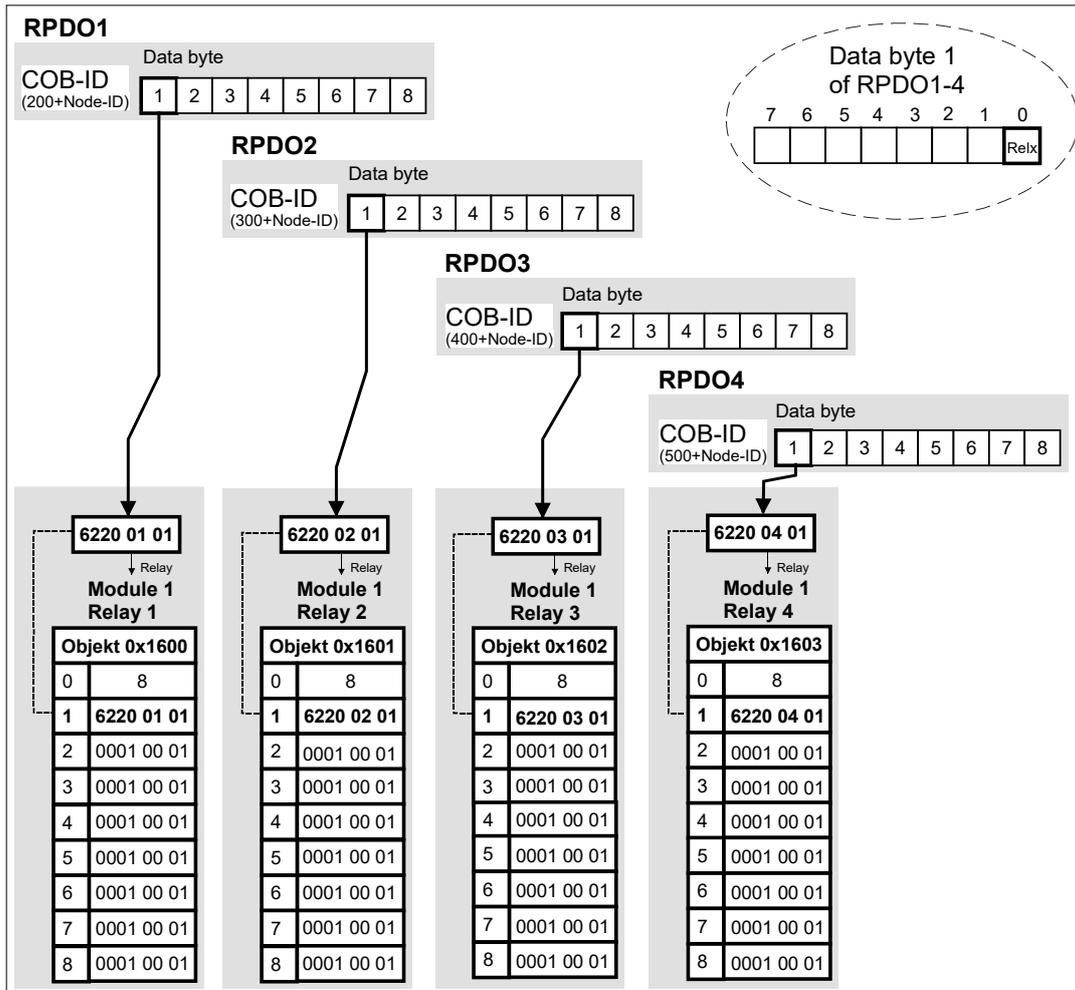

Figure 14: PDO-Mapping with several PDOs

### 4.9.24 NMT Startup (0x1F80)

|               |                    |
|---------------|--------------------|
| <b>INDEX</b>  | <b>0x1F80</b>      |
| Name          | <i>NMT startup</i> |
| Data type     | unsigned 32        |
| Default value | 2                  |

The NMT startup is implemented to be able to start CANopen nodes in environments without NMT-manager.

Via NMT startup the auto startup of a CANopen node can be switched on or off. Further features of the parameters *NMT startup* are currently not supported.

The value range of the object is described in the following table:

| <b>Value</b>     | <b>Meaning</b>                  |
|------------------|---------------------------------|
| 0x00000002       | Auto startup disabled (default) |
| 0x00000008       | Auto startup enabled            |
| all other values | reserved                        |

#### 4.9.25 Self-Starting Nodes Timing Parameters (0x1F91)

|               |  |
|---------------|--|
| <b>INDEX</b>  | <b>0x1F91</b>                                |
| Name          | <i>self-starting nodes timing parameters</i> |
| Data type     | unsigned 16                                  |
| Default value | 100 ms                                       |

| Index         | Sub-index | Description                          | Value range  | Default | Data type   | Access mode |
|---------------|-----------|--------------------------------------|--------------|---------|-------------|-------------|
| <b>0x1F91</b> | 0         | <i>number_of_entries</i>             | 1            | 1       | unsigned 8  | ro          |
|               | 1         | <i>NMT manager detection timeout</i> | 0 ... 0xFFFF | 0x0064  | unsigned 16 | rw          |

Sub-index 1 of this object contains the timeout in [ms] between the change from “preoperational” > “operational”. In default it is 100 ms.

The sub-indices 2 and 3 of this object are not supported.

## 4.10 Device Profile Area

### 4.10.1 Overview of implemented Objects 0x6200 ... 0x6270

| Index  | Name                                 | Data Type   | See page |

| 0x6302 | <i>Change Polarity Output 16-bit</i> | unsigned 16 | 79       |
| 0x6306 | <i>Error Mode Output 16-bit</i>      | unsigned 16 | 80       |
| 0x6307 | <i>Error Value Output 16-bit</i>     | unsigned 16 | 81       |
| 0x6308 | <i>Filter Mask Output 16-bit</i>     | unsigned 16 | 82       |
| 0x6320 | <i>Write Output 32-bit</i>           | unsigned 32 | 83       |
| 0x6322 | <i>Change Polarity Output 32-bit</i> | unsigned 32 | 84       |
| 0x6326 | <i>Error Mode Output 32-bit</i>      | unsigned 32 | 85       |
| 0x6327 | <i>Error Value Output 32-bit</i>     | unsigned 32 | 86       |
| 0x6328 | <i>Filter Mask Output 32-bit</i>     | unsigned 32 | 87       |

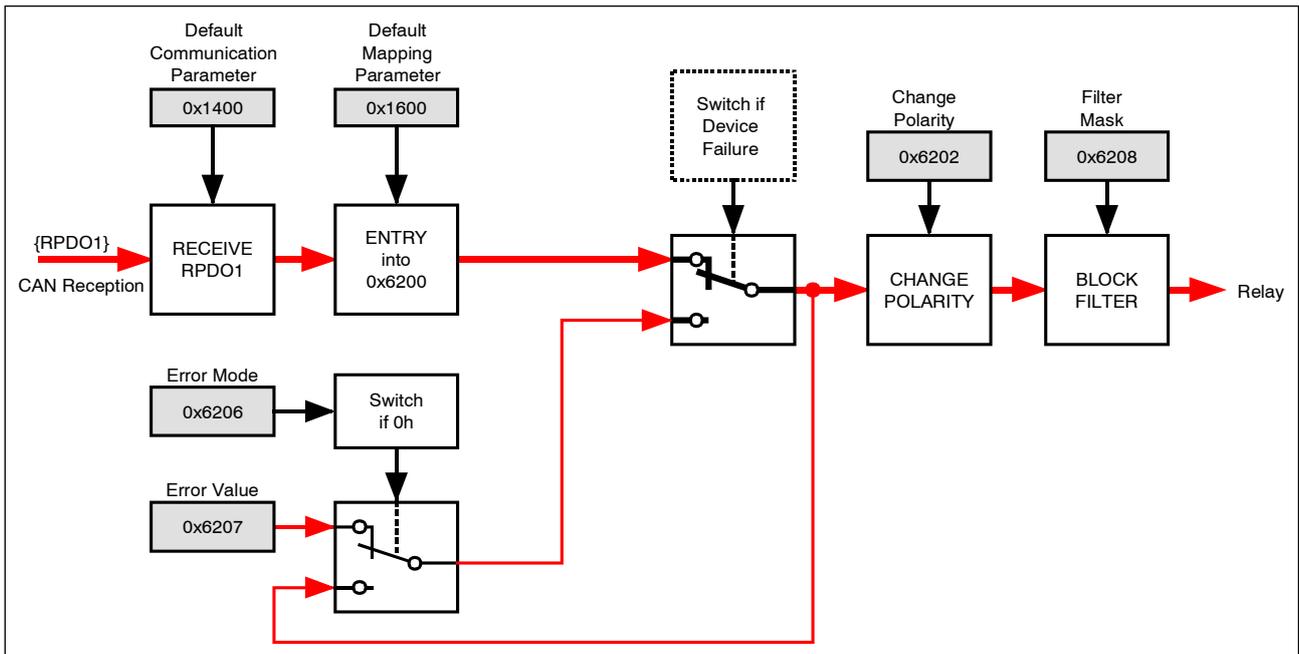

Figure 15: Relationship between the output objects for an 8-bit access

The overview is shown as an example with 8-bit objects. The 1-bit, 16-bit or 32-bit objects for the digital outputs, as shown in Table 10, can be used alternatively

| Name                   | 8-bit object (Example) | Objects that can be used as an alternative |                |                |
|------------------------|------------------------|--|----------------|----------------|
|                        |                        | 1-bit objects                              | 16-bit objects | 32-bit objects |
| Write Output           | 0x6200                 | 0x6220                                     | 0x6300         | 0x6320         |
| Change Polarity Output | 0x6202                 | 0x6240                                     | 0x6302         | 0x6322         |
| Error Mode Output      | 0x6206                 | 0x6250                                     | 0x6306         | 0x6326         |
| Error Value Output     | 0x6207                 | 0x6260                                     | 0x6307         | 0x6327         |
| Filter Mask Output     | 0x6208                 | 0x6270                                     | 0x6308         | 0x6328         |

Table 10: Alternative objects for digital outputs

### 4.10.2 Write Output 8-bit (0x6200)

| Index  | Sub-index | Description               | Value range | Default | PDO Mapping | Data type  | Access mode |
|--------|-----------|---------------------------|-------------|---------|-------------|------------|-------------|
| 0x6200 | 0         | <i>no_of_entries</i>      | -           | 1       | 0           | unsigned 8 | ro          |
|        | 1         | <i>write_output_8-bit</i> | 0 ... 0xF   | 0       | 1           | unsigned 8 | rw          |

#### Assignment of the variable *write\_output\_8-bit*:

Index: 0x6200, Sub-index: 1

| Bit:   | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|--------|---|---|---|---|--------------|--------------|--------------|--------------|
| Relay: | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

|  |
|--|
| Output of relay x is <b>not switched</b> |
| Output of relay x is <b>switched</b>     |

| Bit value <i>Rel_x</i> | Meaning                             |
|------------------------|-------------------------------------|
| 0                      | Relay coil x is <b>de-energized</b> |
| 1                      | Relay coil x is <b>energized</b>    |

(x = 1 ... 4)

### 4.10.3 Change Polarity Output 8-bit (0x6202)

This object inverts the relay coil control voltage.

| Index  | Sub-index | Description                         | Value range | Default | PDO Mapping | Data type  | Access mode |
|--------|-----------|-------------------------------------|-------------|---------|-------------|------------|-------------|
| 0x6202 | 0         | <i>number_of_entries</i>            | -           | 1       | 0           | unsigned 8 | ro          |
|        | 1         | <i>change_polarity_output_8-bit</i> | 0...0xF     | 0       | 0           | unsigned 8 | rw          |

#### Assignment of the variable *change\_polarity\_output\_DO8-DO1*:

This variable determines whether a relay is inverted.

| Bit:   | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|--------|---|---|---|---|--------------|--------------|--------------|--------------|
| Relay: | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

| Bit value <i>Rel_x</i> | Meaning  |
|------------------------|--|
| 0                      | Digital output of relay x is <b>not inverted</b> .<br>Relay coil x is <b>energized</b> by setting the output bit of object 0x6200 to '1' |
| 1                      | Digital output of relay x is <b>inverted</b> .<br>Relay coil x is <b>energized</b> by setting the output bit of object 0x6200 to '0'     |

(x = 1 ... 4)

#### 4.10.4 Error Mode Output 8-bit (0x6206)

The error mode is evaluated if the module is switched into *Stopped* state.

This object and object 0x1029 together determine whether the relays are set to an error value in case of an internal device error. The error value is specified in object 0x6207.

| Index  | Sub-index | Description                    | Value range | Default | PDO Mapping | Data type  | Access mode |
|--------|-----------|--------------------------------|-------------|---------|-------------|------------|-------------|
| 0x6206 | 0         | <i>number_of_entries</i>       | -           | 1       | 0           | unsigned 8 | ro          |
|        | 1         | <i>error_mode_output_8-bit</i> | 0...0xF     | 0xF     | 0           | unsigned 8 | rw          |

##### Assignment of the variable *error\_mode\_output\_8-bit*:

This object determines whether the relays are set to an error value defined in object 0x6207, in case of an internal device failure.

| Bit:   | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|--------|---|---|---|---|--------------|--------------|--------------|--------------|
| Relay: | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

| Bit value <i>Rel_x</i> | Meaning  |
|------------------------|--|
| 1                      | Relay state is set to the value predefined in object 0x6207 (default). |
| 0                      | Relay state shall be kept if an error occurs.                          |

(*x* = 1 ... 4)

### 4.10.5 Error Value Output 8-bit (0x6207)

On condition that the corresponding error mode (object 0x6206) is enabled, device errors shall switch the relays to the error value defined in this object.

| Index  | Sub-index | Description                     | Value range | Default | PDO Mapping | Data type  | Access mode |
|--------|-----------|---------------------------------|-------------|---------|-------------|------------|-------------|
| 0x6207 | 0         | <i>number_of_entries</i>        | -           | 1       | 0           | unsigned 8 | ro          |
|        | 1         | <i>error_value_output_8-bit</i> | 0...0xF     | 0       | 0           | unsigned 8 | rw          |

#### Assignment of the variable *error\_value\_output\_8-bit*:

| Bit:   | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|--------|---|---|---|---|--------------|--------------|--------------|--------------|
| Relay: | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

This variable contains the value, a relay is set to if an error occurs.

| Bit value <i>Rel_x</i> | Meaning  |
|------------------------|--|
| 0                      | If object 0x6206 is enabled, relay x will be <b>de-energized</b> in case of fault. |
| 1                      | If object 0x6206 is enabled, relay x will be <b>energized</b> in case of fault.    |

(x = 1 ... 4)

### 4.10.6 Filter Mask Output 8-bit (0x6208)

This object defines an additional configurable filter mask for a group of the four relays.

| Index  | Sub-index | Description                     | Value range | Default | PDO Mapping | Data type  | Access mode |
|--------|-----------|---------------------------------|-------------|---------|-------------|------------|-------------|
| 0x6208 | 0         | <i>number_of_entries</i>        | -           | 1       | 0           | unsigned 8 | ro          |
|        | 1         | <i>filter_mask_output_8-bit</i> | 0...0xF     | 0xF     | 0           | unsigned 8 | rw          |

Assignment of the variable *filter\_mask\_output\_8-bit*:

| Bit:   | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|--------|---|---|---|---|--------------|--------------|--------------|--------------|
| Relay: | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

| Bit value <i>Relx</i> | Meaning   |
|-----------------------|---|
| 1                     | Relay x <b>is set</b> to the received output value (default).                 |
| 0                     | Relay x <b>is not set</b> to the new output value. The current value is kept. |

(*x=1...4*)

### 4.10.7 Write Output 1-bit (0x6220)

With this object the relays 1 to 4 can be switched.

| Index  | Sub-index | Description                    | Value range | Default | PDO Mapping | Data type  | Access mode |
|--------|-----------|--------------------------------|-------------|---------|-------------|------------|-------------|
| 0x6220 | 0         | <i>number_of_entries</i>       | -           | 4       | 0           | unsigned 8 | ro          |
|        | 1         | <i>write_output_1-bit_Rel1</i> | 0, 1        | 0       | 1           | Boolean    | rww         |
|        | 2         | <i>write_output_1-bit_Rel2</i> | 0, 1        | 0       | 1           | Boolean    | rww         |
|        | 3         | <i>write_output_1-bit_Rel3</i> | 0, 1        | 0       | 1           | Boolean    | rww         |
|        | 4         | <i>write_output_1-bit_Rel4</i> | 0, 1        | 0       | 1           | Boolean    | rww         |

#### Assignment of the variable *write\_output\_1-bit\_Relx* ( $x=1...4$ )

| <i>write_output_Relx</i> | Value | Meaning                             |
|--------------------------|-------|-------------------------------------|
| false                    | 0     | Relay coil x is <b>de-energized</b> |
| true                     | 1     | Relay coil x is <b>energized</b>    |

( $x=1...4$ )

### 4.10.8 Change Polarity 1-bit (0x6240)

This object inverts the relay coil control voltage.

| Index  | Sub-index | Description                       | Value range | Default | PDO Mapping | Data type  | Access mode |
|--------|-----------|-----------------------------------|-------------|---------|-------------|------------|-------------|
| 0x6240 | 0         | <i>number_of_entries</i>          | -           | 4       | 0           | unsigned 8 | ro          |
|        | 1         | <i>change_polarity_1-bit_Rel1</i> | 0, 1        | 0       | 0           | Boolean    | rw          |
|        | 2         | <i>change_polarity_1-bit_Rel2</i> | 0, 1        | 0       | 0           | Boolean    | rw          |
|        | 3         | <i>change_polarity_1-bit_Rel3</i> | 0, 1        | 0       | 0           | Boolean    | rw          |
|        | 4         | <i>change_polarity_1-bit_Rel4</i> | 0, 1        | 0       | 0           | Boolean    | rw          |

#### Assignment of the variable *change\_polarity\_1-bit\_Relx* ( $x=1...4$ )

| <i>change_polarity_Relx</i> | Value | Meaning  |
|-----------------------------|-------|--|
| false                       | 0     | The relay coil control voltage of relay $x$ is <b>not inverted</b> |
| true                        | 1     | The relay coil control voltage of relay $x$ is <b>inverted</b>     |

( $x=1...4$ )

### 4.10.9 Error Mode Output 1-bit (0x6250)

This object determines whether the relays are set to an error value defined in object 0x6260, in case of an internal device error indication.

| Index  | Sub-index | Description                  | Value range | Default | PDO Mapping | Data type  | Access mode |
|--------|-----------|------------------------------|-------------|---------|-------------|------------|-------------|
| 0x6250 | 0         | <i>number_of_entries</i>     | -           | 4       | 0           | unsigned 8 | ro          |
|        | 1         | <i>error_mode_1-bit_Rel1</i> | 0, 1        | 1       | 0           | Boolean    | rw          |
|        | 2         | <i>error_mode_1-bit_Rel2</i> | 0, 1        | 1       | 0           | Boolean    | rw          |
|        | 3         | <i>error_mode_1-bit_Rel3</i> | 0, 1        | 1       | 0           | Boolean    | rw          |
|        | 4         | <i>error_mode_1-bit_Rel4</i> | 0, 1        | 1       | 0           | Boolean    | rw          |

#### Assignment of the variable *error\_mode\_1-bit\_Relx* ( $x=1...4$ )

| <i>error_mode_Relx</i> | Value | Meaning   |
|------------------------|-------|---|
| true                   | 1     | <b>Set</b> the output of relay x to the error value predefined in object 0x6260 in case of an error (default) |
| false                  | 0     | The current state of relay x is kept if an internal device error occurs.                                      |

( $x=1...4$ )

#### 4.10.10 Error Value Output Bit 1 to 4 (0x6260)

On condition that the corresponding error mode (object 0x6250) is enabled, device errors shall switch the relays to the error value defined in this object.

| Index  | Sub-index | Description                   | Value range | Default | PDO Mapping | Data type  | Access mode |
|--------|-----------|-------------------------------|-------------|---------|-------------|------------|-------------|
| 0x6260 | 0         | <i>number_of_entries</i>      | -           | 4       | 4           | unsigned 8 | ro          |
|        | 1         | <i>error_value_1-bit_Rel1</i> | 0, 1        | 0       | 0           | Boolean    | rw          |
|        | 2         | <i>error_value_1-bit_Rel2</i> | 0, 1        | 0       | 0           | Boolean    | rw          |
|        | 3         | <i>error_value_1-bit_Rel3</i> | 0, 1        | 0       | 0           | Boolean    | rw          |
|        | 4         | <i>error_value_1-bit_Rel4</i> | 0, 1        | 0       | 0           | Boolean    | rw          |

#### Assignment of the variable *error\_value\_Rel<sub>x</sub>* (*x=1...4*)

This variable contains the error value.

| <i>error_value_Rel<sub>x</sub></i> | Value | Meaning   |
|------------------------------------|-------|---|
| true                               | 1     | If object 0x6250 is enabled, relay <i>x</i> is <b>energized</b> in case of error.       |
| false                              | 0     | If object 0x6250 is enabled, relay <i>x</i> is <b>de-energized</b> in case of an error. |

(*x=1...4*)

### 4.10.11 Filter Mask Output 1-bit (0x6270)

This object defines an additional configurable filter mask for a single relay.

| Index         | Sub-index | Description                   | Value range | Default | PDO Mapping | Data type  | Access mode |
|---------------|-----------|-------------------------------|-------------|---------|-------------|------------|-------------|
| <b>0x6270</b> | 0         | <i>number_of_entries</i>      | -           | 4       | 0           | unsigned 8 | ro          |
|               | 1         | <i>filter_mask_1-bit_Rel1</i> | 0, 1        | 1       | 0           | Boolean    | rw          |
|               | 2         | <i>filter_mask_1-bit_Rel2</i> | 0, 1        | 1       | 0           | Boolean    | rw          |
|               | 3         | <i>filter_mask_1-bit_Rel3</i> | 0, 1        | 1       | 0           | Boolean    | rw          |
|               | 4         | <i>filter_mask_1-bit_Rel4</i> | 0, 1        | 1       | 0           | Boolean    | rw          |

#### Assignment of the variable *filter\_mask\_1-bit\_Relx* ( $x=1...4$ )

| <i>filter_mask_Relx</i> | Value | Meaning   |
|-------------------------|-------|---|
| true                    | 1     | <b>Set</b> the output of relay x to the received output value.                                      |
| false                   | 0     | The output of relay x is <b>not set</b> to the received output value.<br>The current value is kept. |

( $x=1...4$ )

## 4.10.12 Write Output 16-bit (0x6300)

| Index  | Sub-index | Description                | Value range | Default | PDO Mapping | Data type   | Access mode |
|--------|-----------|----------------------------|-------------|---------|-------------|-------------|-------------|
| 0x6300 | 0         | <i>no_of_entries</i>       | -           | 1       | 0           | unsigned 8  | ro          |
|        | 1         | <i>write_output_16-bit</i> | 0 ... 0xF   | 0       | 0           | unsigned 16 | rww         |

Assignment of the variable *write\_output\_16-bit*:

Index: 0x6300, Sub-index: 1

| Bit:   | 15 ... | ...8 | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|--------|--------|------|---|---|---|---|--------------|--------------|--------------|--------------|
| Relay: | -      | -    | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

| Bit value <i>Rel_x</i> | Meaning                                    |
|------------------------|--|
| 0                      | Relay coil <i>x</i> is <b>de-energized</b> |
| 1                      | Relay coil <i>x</i> is <b>energized</b>    |

(x = 1 ... 4)

### 4.10.13 Change Polarity Output 16-bit (0x6302)

This object inverts the relay coil control voltage.

| Index  | Sub-index | Description                          | Value range | Default | PDO Mapping | Data type   | Access mode |
|--------|-----------|--------------------------------------|-------------|---------|-------------|-------------|-------------|
| 0x6302 | 0         | <i>number_of_entries</i>             | -           | 1       | 0           | unsigned 8  | ro          |
|        | 1         | <i>change_polarity_output_16-bit</i> | 0...0xF     | 0       | 0           | unsigned 16 | rw          |

#### Assignment of the variable *change\_polarity\_output\_16-bit*:

This variable determines whether a relay is inverted.

Index: 0x6302, Sub-index: 1

| Bit:   | 15 ... | ...8 | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|--------|--------|------|---|---|---|---|--------------|--------------|--------------|--------------|
| Relay: | -      | -    | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

| Bit value <i>Rel_x</i> | Meaning  |
|------------------------|--|
| 0                      | Digital output of relay <i>x</i> is <b>not inverted</b> .<br>Relay coil <i>x</i> is <b>energized</b> by setting the output bit of object 0x6300 to '1' |
| 1                      | Digital output of relay <i>x</i> is <b>inverted</b> .<br>Relay coil <i>x</i> is <b>energized</b> by setting the output bit of object 0x6300 to '0'     |

(*x* = 1 ... 4)

### 4.10.14 Error Mode Output 16-bit (0x6306)

The error mode is evaluated if the module is switched into *Stopped* state.

This object and object 0x1029 together determine whether the relays are set to an error value in case of an internal device error. The error value is specified in object 0x6307.

| Index  | Sub-index | Description                     | Value range | Default | PDO Mapping | Data type   | Access mode |
|--------|-----------|---------------------------------|-------------|---------|-------------|-------------|-------------|
| 0x6306 | 0         | <i>number_of_entries</i>        | -           | 1       | 0           | unsigned 8  | ro          |
|        | 1         | <i>error_mode_output_16-bit</i> | 0..0xF      | 0xF     | 0           | unsigned 16 | rw          |

#### Assignment of the variable *error\_mode\_output\_16-bit*:

This object determines whether the relays are set to an error value defined in object 0x6307, in case of an internal device failure.

Index: 0x6306, Sub-index: 1

| Bit:   | 15 ... | ...8 | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|--------|--------|------|---|---|---|---|--------------|--------------|--------------|--------------|
| Relay: | -      | -    | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

| Bit value <i>Rel_x</i> | Meaning  |
|------------------------|--|
| 1                      | Relay state is set to the value predefined in object 0x6307 (default). |
| 0                      | Relay state shall be kept if an error occurs.                          |

(*x* = 1 ... 4)

### 4.10.15 Error Value Output 16-bit (0x6307)

On condition that the corresponding error mode (object 0x6306) is enabled, device errors shall switch the relays to the error value defined in this object.

| Index  | Sub-index | Description                      | Value range | Default | PDO Mapping | Data type   | Access mode |
|--------|-----------|----------------------------------|-------------|---------|-------------|-------------|-------------|
| 0x6307 | 0         | <i>number_of_entries</i>         | -           | 1       | 0           | unsigned 8  | ro          |
|        | 1         | <i>error_value_output_16-bit</i> | 0...0xF     | 0       | 0           | unsigned 16 | rw          |

#### Assignment of the variable *error\_value\_output\_16-bit*:

Index: 0x6307, Sub-index: 1

| Bit:   | 15 ... | ...8 | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|--------|--------|------|---|---|---|---|--------------|--------------|--------------|--------------|
| Relay: | -      | -    | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

This variable contains the value, a relay is set to if an error occurs.

| Bit value <i>Rel_x</i> | Meaning  |
|------------------------|--|
| 0                      | If object 0x6306 is enabled, relay x will be <b>de-energized</b> in case of fault. |
| 1                      | If object 0x6306 is enabled, relay x will be <b>energized</b> in case of fault.    |

(x = 1 ... 4)

### 4.10.16 Filter Mask Output 16-bit (0x6308)

This object defines an additional configurable filter mask for a group of the four relays.

| Index  | Sub-index | Description                      | Value range | Default | PDO Mapping | Data type   | Access mode |
|--------|-----------|----------------------------------|-------------|---------|-------------|-------------|-------------|
| 0x6308 | 0         | <i>number_of_entries</i>         | -           | 1       | 0           | unsigned 8  | ro          |
|        | 1         | <i>filter_mask_output_16-bit</i> | 0...0xF     | 0xF     | 0           | unsigned 16 | rw          |

#### Assignment of the variable *filter\_mask\_output\_16-bit*:

Index: 0x6308, Sub-index: 1

| Bit:   | 15 ... | ...8 | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|--------|--------|------|---|---|---|---|--------------|--------------|--------------|--------------|
| Relay: | -      | -    | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

| Bit value <i>Relx</i> | Meaning  |
|-----------------------|--|
| 1                     | Relay <i>x</i> <b>is set</b> to the received output value (default).                 |
| 0                     | Relay <i>x</i> <b>is not set</b> to the new output value. The current value is kept. |

(*x*=1...4)

### 4.10.17 Write Output 32-bit (0x6320)

| Index  | Sub-index | Description                | Value range | Default | PDO Mapping | Data type   | Access mode |
|--------|-----------|----------------------------|-------------|---------|-------------|-------------|-------------|
| 0x6320 | 0         | <i>number_of_entries</i>   | -           | 1       | 0           | unsigned 8  | ro          |
|        | 1         | <i>write_output_32-bit</i> | 0...0xF     | 0       | 0           | unsigned 32 | rww         |

#### Assignment of the variable *write\_output\_32-bit*:

Index: 0x6320, Sub-index: 1

| Bit:    | 31 ... | ...8 | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|---------|--------|------|---|---|---|---|--------------|--------------|--------------|--------------|
| Output: | -      | -    | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

| Bit value <i>Rel_x</i> | Meaning                                    |
|------------------------|--|
| 0                      | Relay coil <i>x</i> is <b>de-energized</b> |
| 1                      | Relay coil <i>x</i> is <b>energized</b>    |

(*x* = 1 ... 4)

### 4.10.18 Change Polarity Output 32-bit (0x6322)

This object inverts the relay coil control voltage.

| Index  | Sub-index | Description                          | Value range | Default | PDO Mapping | Data type   | Access mode |
|--------|-----------|--------------------------------------|-------------|---------|-------------|-------------|-------------|
| 0x6322 | 0         | <i>number_of_entries</i>             | -           | 1       | 0           | unsigned 8  | ro          |
|        | 1         | <i>change_polarity_output_32-bit</i> | 0...0xF     | 0       | 0           | unsigned 32 | rw          |

#### Assignment of the variable *change\_polarity\_output\_32-bit*:

This variable determines whether a relay is inverted.

Index: 0x6322, Sub-index: 1

| Bit:    | 31 ... | ...8 | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|---------|--------|------|---|---|---|---|--------------|--------------|--------------|--------------|
| Output: | -      | -    | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

| Bit value <i>Rel_x</i> | Meaning  |
|------------------------|--|
| 0                      | Digital output of relay <i>x</i> is <b>not inverted</b> .<br>Relay coil <i>x</i> is <b>energized</b> by setting the output bit of object 0x6320 to '1' |
| 1                      | Digital output of relay <i>x</i> is <b>inverted</b> .<br>Relay coil <i>x</i> is <b>energized</b> by setting the output bit of object 0x6320 to '0'     |

(*x* = 1 ... 4)

### 4.10.19 Error Mode Output 32-bit (0x6326)

The error mode is evaluated if the module is switched into *Stopped* state.

This object and object 0x1029 together determine whether the relays are set to an error value in case of an internal device error. The error value is specified in object 0x6327.

| Index  | Sub-index | Description                     | Value range | Default | PDO Mapping | Data type   | Access mode |
|--------|-----------|---------------------------------|-------------|---------|-------------|-------------|-------------|
| 0x6326 | 0         | <i>number_of_entries</i>        | -           | 1       | 0           | unsigned 8  | ro          |
|        | 1         | <i>error_mode_output_32-bit</i> | 0..0xF      | 0xF     | 0           | unsigned 32 | rw          |

#### Assignment of the variable *error\_mode\_output\_32-bit*:

This object determines whether the relays are set to an error value defined in object 0x6327, in case of an internal device failure.

Index: 0x6326, Sub-index: 1

| Bit:    | 31 ... | ...8 | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|---------|--------|------|---|---|---|---|--------------|--------------|--------------|--------------|
| Output: | -      | -    | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

| Bit value <i>Rel_x</i> | Meaning  |
|------------------------|--|
| 1                      | Relay state is set to the value predefined in object 0x6327 (default). |
| 0                      | Relay state shall be kept if an error occurs.                          |

(*x* = 1 ... 4)

#### 4.10.20 Error Value Output 32-bit (0x6327)

On condition that the corresponding error mode (object 0x6326) is enabled, device errors shall switch the relays to the error value defined in this object.

| Index  | Sub-index | Description                      | Value range | Default | PDO Mapping | Data type   | Access mode |
|--------|-----------|----------------------------------|-------------|---------|-------------|-------------|-------------|
| 0x6327 | 0         | <i>number_of_entries</i>         | -           | 1       | 0           | unsigned 8  | ro          |
|        | 1         | <i>error_value_output_32-bit</i> | 0...0xF     | 0       | 0           | unsigned 32 | rw          |

##### Assignment of the variable *error\_value\_output\_32-bit*:

Index: 0x6327, Sub-index: 1

| Bit:    | 31 ... | ...8 | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|---------|--------|------|---|---|---|---|--------------|--------------|--------------|--------------|
| Output: | -      | -    | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

This variable contains the value. A relay is set to if an error occurs.

| Bit value <i>Rel_x</i> | Meaning  |
|------------------------|--|
| 0                      | If object 0x6326 is enabled, relay x will be <b>de-energized</b> in case of fault. |
| 1                      | If object 0x6326 is enabled, relay x will be <b>energized</b> in case of fault.    |

(x = 1 ... 4)

#### 4.10.21 Filter Mask Output 32-bit (0x6328)

This object defines an additional configurable filter mask for a group of the four relays.

| Index  | Sub-index | Description                      | Value range | Default | PDO Mapping | Data type   | Access mode |
|--------|-----------|----------------------------------|-------------|---------|-------------|-------------|-------------|
| 0x6328 | 0         | <i>number_of_entries</i>         | -           | 1       | 0           | unsigned 8  | ro          |
|        | 1         | <i>filter_mask_output_32-bit</i> | 0...0xF     | 0xF     | 0           | unsigned 32 | rw          |

##### Assignment of the variable *filter\_mask\_output\_32-bit*:

Index: 0x6328, Sub-index: 1

| Bit:    | 31 ... | ...8 | 7 | 6 | 5 | 4 | 3            | 2            | 1            | 0            |
|---------|--------|------|---|---|---|---|--------------|--------------|--------------|--------------|
| Output: | -      | -    | - | - | - | - | <i>Rel_4</i> | <i>Rel_3</i> | <i>Rel_2</i> | <i>Rel_1</i> |

| Bit value <i>Relx</i> | Meaning  |
|-----------------------|--|
| 1                     | Relay <i>x</i> <b>is set</b> to the received output value (default).                 |
| 0                     | Relay <i>x</i> <b>is not set</b> to the new output value. The current value is kept. |

(*x*=1...4)

## 4.11 Firmware Update via CiA 302 Objects 0x1F50...0x1F52

The objects described below are used for program updates via the object dictionary.

### NOTICE

**The firmware update must be carried out only by qualified personnel!**

Faulty program update can result in deleting of the memory and loss of the firmware. The module then cannot be operated further!

### NOTICE

esd offers the program CANfirmdown for a firmware update.  
Please, contact our support for this.

In normal CiA 301 mode the object 0x1F50 cannot be accessed.

The objects 0x1F51 and 0x1F52 are also available in normal CiA 301 mode.

For further information about the objects and the firmware-update please refer to (4).

| Index  | Sub-index | Description                  | Data type  | Access mode |
|--------|-----------|------------------------------|------------|-------------|
| 0x1F50 | 1         | Download program data        | domain     | rw          |
| 0x1F51 | 1         | Program Control (see 0x1F51) | unsigned 8 | rw          |

### 4.11.1 Download Control via Object (0x1F51)

|               |                 |
|---------------|-----------------|
| <b>INDEX</b>  | <b>0x1F51</b>   |
| Name          | Program Control |
| Data type     | unsigned 8      |
| Access type   | rw              |
| Value range   | 0x00...0xFF     |
| Default value | 0               |

### NOTICE

This object is only contained for compatibility reasons.

It is not necessary to erase the firmware beforehand, just send the firmware to object 0x1F50 sub-index 1.

For further information about object 0x1F51 and the firmware-update please refer to the standard (4).

# 5 Technical Data

## 5.1 General Technical Data

|                          |  |
|--------------------------|--|
| Power supply voltage     | Nominal voltage: 24 V<br>Input voltage range: 12 V ... 32 V DC<br>Current consumption: $I_{24V\text{TYPICAL}} = \text{approx. } 42 \text{ mA}$<br>$I_{24V\text{MAX}} = 100 \text{ mA}$ |
| Power consumption        | Typical: 1 W (all relays de-energized)<br>Maximum: 2.4 W (all relays energized)  |
| Protective circuits      | Reverse voltage protection,<br>Overvoltage protection (triggering voltage= 32 V)<br>Polyfuse in the input  |
| Temperature range        | -20 ... +70 °C ambient temperature   |
| Humidity                 | Operation: max. 90%, non-condensing  |
| Protection class         | IP20   |
| Pollution degree         | Maximum permissible according to DIN EN 61131-2:<br>Pollution Degree 2   |
| Housing                  | Plastic housing for carrier rail mounting NS35/7,5 DIN EN 60715  |
| Form factor / Dimensions | Width: 22.5 mm, height: 99 mm, depth: 114.5 mm<br>(without connectors)   |
| Weight                   | ca. 150 g  |

Table 11: General Data of the module

| 24V               | 24V-power supply                       | 4-pos. Phoenix Contact PCB header<br>MSTBO 2,5/ 4-G1L KMGY with cable connector<br>FKCT 2,5/4-ST KMGY with push-in spring connection | 25 mating cycles   |
| InRailBus         | CAN and 24V power supply via InRailBus | (Not a physical component, but contact surfaces on the printed circuit board)<br>5-pos. TBUS connector as accessories                | 25 mating cycles of TBUS-connector                               |

Table 12: Connectors, accessible from outside

## 5.3 CAN Port

|                     |   |
|---------------------|---|
| Number of CAN ports | 1x CAN CC   |
| CAN controller      | acc. to ISO 11898-1 (CAN CC), contained in CPU  |
| CAN protocol        | According to ISO 11898-1  |
| Physical CAN Layer  | High-speed CAN CC port according to ISO 11898-2, bit rate from 10 kbit/s up to 1 Mbit/s   |
| Galvanic isolation  | Separation by means of a digital isolator and DC/DC-converter.<br><br>Voltage over CAN isolation (CAN to housing/EARTH or "PE (mounting rail)"; CAN to Host/System Ground; CAN to CAN): 1kV DC @ 1s (I < 1 mA)<br>Pollution Degree: 2 |
| Bus termination     | None,<br>Terminating resistor must be set externally if required  |
| Connector           | CAN connector or via InRailBus, see 5.2   |

Table 13: Data of the CAN port

## 5.4 Relay Ports

|                           |   |
|---------------------------|---|
| Number                    | 2+2   |
| Relay configuration       | 2 relays with monostable change-over contacts,<br>2 relays with monostable normally open contacts   |
| Relay type                | OMRON G6C-2114Px  |
| Max. switching voltage    | 250 V <sub>AC</sub> , 125 V <sub>DC</sub>   |
| Max. switching power      | Resistive load: 2000 VA (8 A at 250 V AC) /<br>240 W (8 A at 30 V DC);<br>Inductive load: 875 VA (3.5 A at 250 V AC)/<br>105 W (3.5 A at 30 V DC) |
| Endurance mechanical load | Min. 100 000 cycles at 1800 operations per hour (= 30 per minute) with specified load   |
| Galvanic isolation        | Contact coil: 1,000 V <sub>AC</sub> 50/60 Hz @ 1min<br>Contact-contact (open): 1,000 V <sub>AC</sub> 50/60 Hz @1min<br>Pollution Degree: 2        |
| Connector                 | Relay connector, see 5.2  |

Table 14: Data of the relay ports

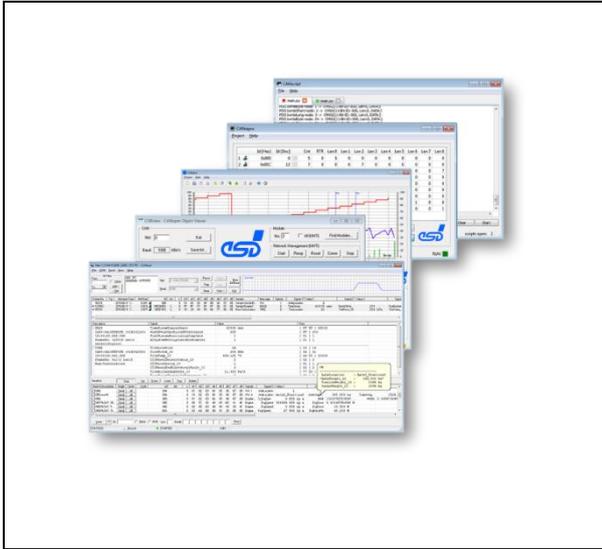

## 5.5 Software Support

### CAN Tools

esd offers additional free-of-charge tools which support efficient setup and analysis of CAN applications and networks.

The CAN Tools are operational with all esd PC-CAN interfaces (e.g. PCIe, USB, EtherCAN/2 ...)

The following CAN Tools are available:

|                  |  |
|------------------|--|
| <b>CANreal</b>   | Display and record of CAN message frames               |
| <b>CANplot</b>   | Graphical display of CAN data                          |
| <b>CANrepro</b>  | Replay of pre-recorded CAN messages                    |
| <b>CANscript</b> | Python based scripting tool                            |
| <b>COBview</b>   | Analysis and diagnostics of CANopen <sup>®</sup> nodes |

**System Requirements:**

- Windows 32-bit or 64-bit system
- 50 MB free HD drive space
- esd CAN driver installed

As part of the esd software development kit (CAN SDK) of the NTCAN-API the CAN Tools are included in delivery of the CAN-CD.

The CAN SDK can also be downloaded free-of-charge from the esd website.

# 6 Connector Assignments

## 6.1 Relays

**NOTICE**  
 A mixed assignment of the four relay ports with dangerous voltages and safety extra-low voltages ( $U_{AC} < 30V$ , 42.4 V peak value or  $U_{DC} < 60V$ ) is not recommended, as the galvanic isolation between the ports only represents basic insulation!

**DANGER**  
 The user must ensure that the load circuits of the relays are protected against overload by suitable protective measures (e.g. shutdown devices)!

**Device connector:** Phoenix Contact PCB header MC 1,5/10-G-5,08  
**Cable plug:** Phoenix Contact pluggable connector MC 1,5/10-ST-5,08, Screw connection, 5.08 mm pitch  
 Phoenix Contact Order No.: 1836150, included in delivery  
 For conductor connection, cross section and stripping length see page 97.

**Pin Position:**  
(cable plug)

**Pin Assignment:**

| Pin | Imprint | Signal | Relay   |
|-----|---------|--------|---------|
| 1   | 14      | NO     | Relay 1 |
| 2   | 11      | COM    |         |
| 3   | 12      | NC     |         |
| 4   | 24      | NO     | Relay 2 |
| 5   | 23      | COM    |         |
| 6   | 34      | NO     | Relay 3 |
| 7   | 31      | COM    |         |
| 8   | 32      | NC     |         |
| 9   | 44      | NO     | Relay 4 |
| 10  | 43      | COM    |         |

**Signal Description:**

- NO... Normally opened contact, also: Make
- COM... Change-over contact, also: Break - Make (B-M)
- NC ... Normally closed contact, also: Break

## 6.2 24V Power Supply Voltage

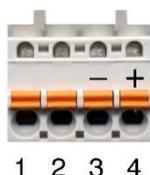

### DANGER

The CAN-CBX-REL4/2 is a device of protection class III according to DIN EN 61140 and may only be operated on supply circuits that offer sufficient protection against dangerous voltages.

**Device socket:** Phoenix Contact PCB header MSTBO 2,5/4-G1L-KMGY  
**Cable plug:** Phoenix Contact pluggable connector FKCT 2,5/4-ST, 5.0 mm pitch, Push-in-spring-connection, included in the scope of delivery (Phoenix Contact order No.: 19 21 90 0)  
 For conductor connection, cross section and stripping length see page 97.

### Pin Position on cable plug:

### Pin Assignment:

|                      |        |        |     |   |
|----------------------|--------|--------|-----|---|
| Device housing label |        |        | 24V |   |
| Connector label      | .      | .      | M   | P |
|                      | (none) | (none) | -   | + |

| Pin    | 1               | 2            | 3            | 4               |
|--------|-----------------|--------------|--------------|-----------------|
| Signal | P24<br>(+ 24 V) | M24<br>(GND) | M24<br>(GND) | P24<br>(+ 24 V) |

Please refer to the connecting diagram page 13.

### NOTICE

The P24 pins (pin 1, 4) are connected internally!  
 The M24 pins (pin 2, 3) are connected internally!

### NOTICE

There is a connection between the 24V plug and the InRailBus so that the module can be supplied via the InRailBus. Note that this connection is not designed to feed the 24V supply voltage via the plug to the InRailBus.

Feeding through the 24V power supply voltage can cause damage on the module!  
 Further wiring via the plug is possible if the modules are mounted on the DIN rail without InRailBus connectors. Use pin 1 and 2 as input wiring and pins 3 and 4 as output to the next module for example. Note that the limit values of the plug must not be exceeded and that voltage drops may occur in the plug.

- Make absolutely sure to connect the cables correctly to the cable plug!
- Use only suitable cables for the line plug.

### Signal Description:

P24... Power supply voltage (Nominal voltage = +24 V)

M24... Reference potential

## 6.3 CAN

### 6.3.1 CAN Port

The CAN bus signals are galvanically isolated from the other signals via digital isolator and DC/DC-converter.

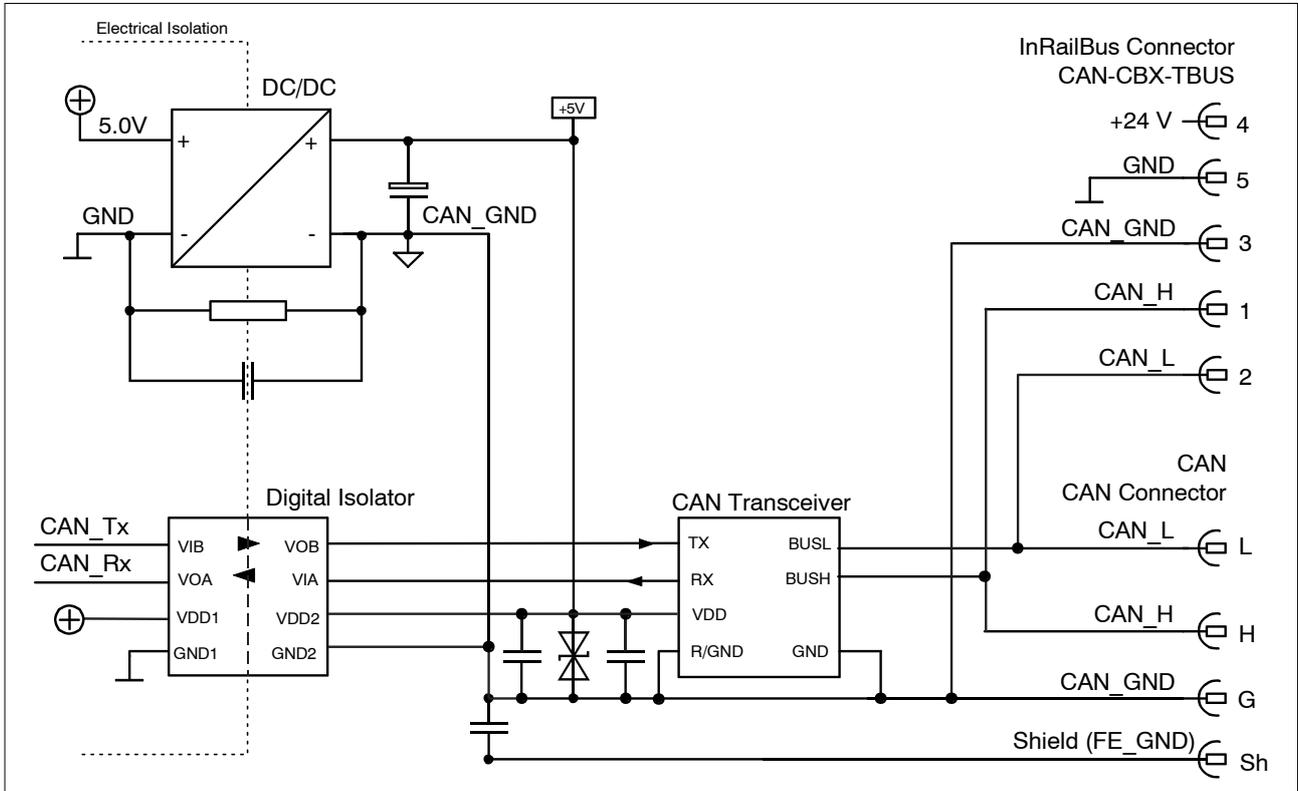

Figure 16: CAN Port

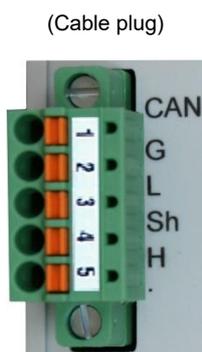

The CAN port can be connected via the CAN connector (see chapter 6.3.2) or optionally via the InRailBus (see chapter 6.4).

## 6.3.2 CAN Connector

The CAN port is connected via the via this CAN connector on the upper side of the module or optional via the InRailbus (see page 96)

**Device connector:** Phoenix Contact PCB header MC 1,5/5-GF-3,81  
**Cable plug:** Phoenix Contact pluggable connector FK-MCP 1,5/5-STF-3,81, Push-in spring connection, 3.81 mm pitch  
 Phoenix Contact Order No.: 1851261 (included in delivery)  
 For conductor connection, cross section and stripping length see page 97

### Pin Position:

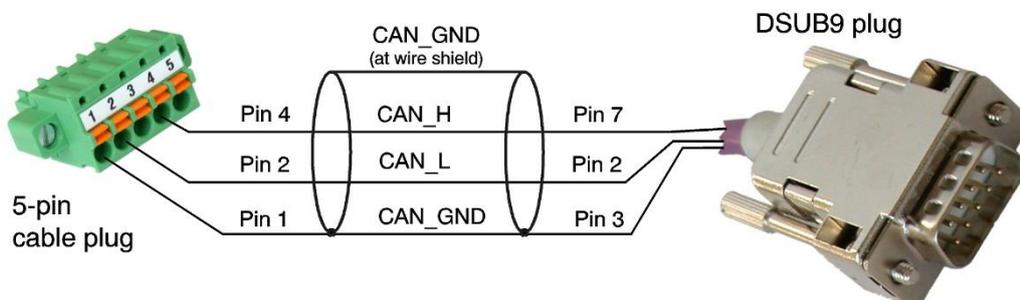

### Pin Assignment:

| Imprint   | Signal  | Pin |
|-----------|---------|-----|
| <b>G</b>  | CAN_GND | 1   |
| <b>L</b>  | CAN_L   | 2   |
| <b>Sh</b> | Shield  | 3   |
| <b>H</b>  | CAN_H   | 4   |
| <b>•</b>  | -       | 5   |

### Signal Description:

CAN\_L, CAN\_H ... CAN signal lines of the CAN port  
 CAN\_GND ... Reference potential of the local CAN physical layer of CAN x (x = 0, 1)  
 To ensure reliable CAN communication, this pin must always be connected!  
 Shield ... Pin for line shield connection (using hat rail mounting direct contact to the mounting rail potential)  
 - ... Reserved, do not connect

Recommendation of an adapter cable from 5-pin cable plug (here Phoenix Contact FK-MCP1,5/5-STF\_3,81 with spring-cage-connection) to 9-pin DSUB:

The assignment of the 9-pin DSUB-connector and the cable plug is designed according to CiA 106 .

### INFORMATION

esd offers assembled CAN cables according to recommendations of CiA 303 part1 and CiA 106 (5) as accessories, see Order Information, page 111.

### 6.4 24 V and CAN via InRailBus

Power supply voltage and CAN can optionally be fed via the InRailBus. Use the mounting-rail bus connector (CAN-CBX-TBus) for the connection via the InRailBus, see Order Information (page 111). Read and follow the instructions for connecting power supply and CAN signals via InRailBus (see from page 22 and page 93)!

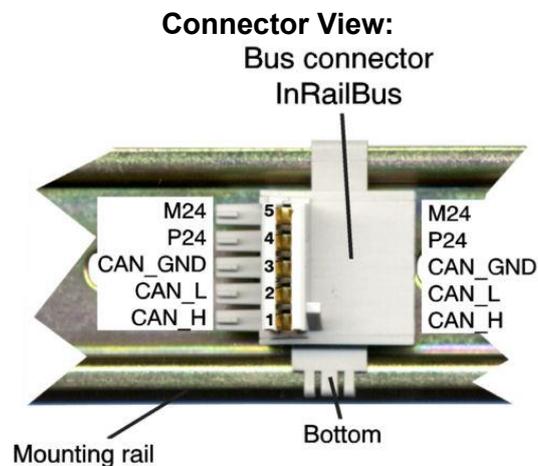

#### 6.4.1 Connector Assignment 24V and CAN via InRailBus

#### DANGER

The CAN-CBX-REL4/2 is a device of protection class III according to DIN EN 61140 and may only be operated on supply circuits that offer sufficient protection against dangerous voltages.

Connector type: Mounting-rail bus connector of the CBX-InRailBus  
Phoenix Contact ME 22,5 TBUS 1,5/5-ST-3,81 KMGY

#### Pin Assignment:

| Pin | Signal      |
|-----|-------------|
| 5   | M24 (GND)   |
| 4   | P24 (+24 V) |
| 3   | CAN_GND     |
| 2   | CAN_L       |
| 1   | CAN_H       |
| S   | FE (PE_GND) |

#### Signal Description:

CAN\_L, CAN\_H ... CAN signals  
 CAN\_GND ... reference potential of the local CAN-Physical layers  
 P24... power supply voltage +24 V  
 M24... reference potential  
 FE... functional earth contact (EMC) (connected to mounting rail potential)

## 6.5 Conductor Connection/Conductor Cross Section

### NOTICE

The user must ensure that the cables used are designed for the connected voltages and currents in terms of dielectric strength, conductor cross-section and temperature range!

The following table contains an extract of the technical data of the cable plugs:

| Characteristics  | Connector Type <sup>1</sup>                  |   |   |
|--|--|---|---|
|  | Power Supply Voltage 24 V Cable connector    | CAN Cable connector                           | Relay Contacts                                |
| Connector type plug component  | FKCT 2,5/...-ST KMGY                         | FK-MCP 1,5/5-STF-3,81                         | MC 1,5/...-ST-5,08                            |
| Connection method  | Push-in spring connection                    | Push-in spring connection                     | Screw connection with tension sleeve          |
| Conductor material   | Copper                                       | Copper  | Copper  |
| Stripping length   | 10 mm  | 9 mm  | 7 mm  |
| Nominal cross section  | 2.5 mm <sup>2</sup>                          | 1.5 mm <sup>2</sup>                           | 1.5 mm <sup>2</sup>                           |
| Conductor cross section rigid.   | 0.2 mm <sup>2</sup> ... 2.5 mm <sup>2</sup>  | 0.14 mm <sup>2</sup> ... 1.5 mm <sup>2</sup>  | 0.14 mm <sup>2</sup> ... 1.5 mm <sup>2</sup>  |
| Conductor cross section flexible   | 0.2 mm <sup>2</sup> ... 2.5 mm <sup>2</sup>  | 0.14 mm <sup>2</sup> ... 1.5 mm <sup>2</sup>  | 0.14 mm <sup>2</sup> ... 1.5 mm <sup>2</sup>  |
| Conductor cross section AWG  | 24 ... 12                                    | 26 ... 16                                     | 28 ... 16                                     |
| Conductor cross section flexible, with ferrule without plastic sleeve                        | 0.25 mm <sup>2</sup> ... 2.5 mm <sup>2</sup> | 0.25 mm <sup>2</sup> ... 1.5 mm <sup>2</sup>  | 0.25 mm <sup>2</sup> ... 1.5 mm <sup>2</sup>  |
| Conductor cross section flexible, with ferrule with plastic sleeve                           | 0.25 mm <sup>2</sup> ... 2.5 mm <sup>2</sup> | 0.25 mm <sup>2</sup> ... 0.75 mm <sup>2</sup> | 0.25 mm <sup>2</sup> ... 0.5 mm <sup>2</sup>  |
| 2 conductors with same cross section, solid  | n.a.   | n.a.  | 0.08 mm <sup>2</sup> ... 0.5 mm <sup>2</sup>  |
| 2 conductors with same cross section, flexible   | n.a.   | n.a.  | 0.08 mm <sup>2</sup> ... 0.75 mm <sup>2</sup> |
| 2 conductors with same cross section, flexible, with ferrule without plastic sleeve          | n.a.   | n.a.  | 0.25 mm <sup>2</sup> ... 0.34 mm <sup>2</sup> |
| 2 conductors with same cross section, stranded, TWIN ferrules with plastic sleeve, min./max. | 0.5 mm <sup>2</sup> ... 1.5 mm <sup>2</sup>  | n.a.  | 0.5 mm <sup>2</sup> ... 0.5 mm <sup>2</sup>   |

<sup>1</sup> Technical data from Phoenix Contact website, printed circuit board connector, plug component

The following table contains an extract of the technical data of the optional InRail Bus Connectors:

| Characteristics of optional InRailBus Connectors   | Connector Type <sup>1</sup>                  |  |
|--|--|--|
|  | CAN-CBX-TBus-Connector-Socket                | CAN-CBX-TBus-Connector-Plug                  |
| Connector type plug component  | MCVR 1,5/5-ST-3,81 AU                        | IMC 1,5/ 5-ST-3,81 AU                        |
| Connection method  | Screw connection with tension sleeve         | Screw connection with tension sleeve         |
| Conductor material   | Copper                                       | Copper                                       |
| Stripping length   | 7 mm   | 7 mm   |
| Nominal cross section  | 1.5 mm <sup>2</sup>                          | 1.5 mm <sup>2</sup>                          |
| Conductor cross section rigid.   | 0.14 mm <sup>2</sup> ... 1.5 mm <sup>2</sup> | 0.14 mm <sup>2</sup> ... 1.5 mm <sup>2</sup> |
| Conductor cross section flexible   | 0.14 mm <sup>2</sup> ... 0.5 mm <sup>2</sup> | 0.14 mm <sup>2</sup> ... 1.5 mm <sup>2</sup> |
| Conductor cross section AWG  | 28 ... 16                                    | 28 ... 16                                    |
| Conductor cross section flexible, with ferrule without plastic sleeve                        | 0.25 mm <sup>2</sup> ... 1.5 mm <sup>2</sup> | 0.25 mm <sup>2</sup> ... 1.5 mm <sup>2</sup> |
| Conductor cross section flexible, with ferrule with plastic sleeve                           | 0.25 mm <sup>2</sup> ... 0.5 mm <sup>2</sup> | 0.25 mm <sup>2</sup> ... 0.5 mm <sup>2</sup> |

# 7 Correct Wiring of Galvanically Isolated CAN Networks

## NOTICE

This chapter applies to CAN networks with bit rates up to 1 Mbit/s.

If you work with higher bit rates, as for example used for CAN FD, the information given in this chapter must be examined for applicability in each individual case.

For further information refer to the CiA® CAN FD guidelines and recommendations (<https://www.can-cia.org/>).

For the CAN wiring all applicable rules and regulations (EU, DIN), such as regarding electromagnetic compatibility, security distances, cable cross-section or material, must be obeyed.

## 7.1 CAN Wiring Standards

The flexibility in CAN network design is a major strength of the various extensions based on the original CAN standard ISO 11898-2, such as CANopen®, ARINC825, DeviceNet® and NMEA2000. However, taking advantage of this flexibility absolutely requires a network design that considers the interactions of all network parameters.

In some cases, the CAN organizations have adapted the scope of CAN in their specifications to enable applications outside the ISO 11898 standard. They have imposed system-level restrictions on data rate, line length and parasitic bus loads.

However, when designing CAN networks, a margin must always be planned for signal losses over the entire system and cabling, parasitic loads, network imbalances, potential differences against earth potential, and signal integrities. **Therefore, the maximum achievable number of nodes, bus lengths and stub lengths may differ from the theoretically possible number!**

esd has limited its recommendations for CAN wiring to the specifications of ISO 11898-2. A description of the special features of the derived specifications CANopen, ARINC825, DeviceNet, and NMEA2000 is omitted here.

The consistent compliance with the ISO 11898-2 standard offers significant advantages:

- Reliable operation due to proven design specifications
- Minimization of error sources due to sufficient distance to the physical limits.
- Easy maintenance because there are no "special cases" to consider for future network modifications and troubleshooting.

Of course, reliable networks can be designed according to the specifications of CANopen, ARINC825, DeviceNet and NMEA2000, **however it is strictly not recommended to mix the wiring guidelines of the various specifications!**

## 7.2 Light Industrial Environment (*Single Twisted Pair Cable*)

### 7.2.1 General Rules

**NOTICE**

esd grants the EU Conformity of the product if the CAN wiring is carried out with at least single shielded **single** twisted pair cables that match the requirements of ISO 11898-2. Single shielded *double* twisted pair cable wiring as described in chapter 7.3 ensures the EU Conformity as well.

The following **general rules** for CAN wiring with single shielded *single* twisted pair cable should be followed:

|   |  |
|---|--|
| 1 | A suitable cable type with a wave impedance of about $120\ \Omega \pm 10\%$ with an adequate conductor cross-section ( $\geq 0.22\ \text{mm}^2$ ) must be used. The voltage drop over the wire must be considered.   |
| 2 | For light industrial environment use at least a two-wire CAN cable, the wires of which must be assigned as follows: <ul style="list-style-type: none"> <li>• Two twisted wires must be assigned to the data signals (CAN_H, CAN_L).</li> <li>• The cable shield must be connected to the reference potential (CAN_GND).</li> </ul> |
| 3 | The reference potential CAN_GND must be connected to the functional earth (FE) at exactly <b>one</b> point.  |
| 4 | A CAN bus line must not branch (exception: short cable stubs) and must be terminated with the characteristic impedance of the line (generally $120\ \Omega \pm 10\%$ ) at both ends (between the signals CAN_L and CAN_H and <b>not</b> at CAN_GND).   |
| 5 | Keep cable stubs as short as possible ( $l < 0.3\ \text{m}$ ).   |
| 6 | Select a working combination of bit rate and cable length.   |
| 7 | Keep away cables from disturbing sources. If this cannot be avoided, double shielded wires are recommended.  |

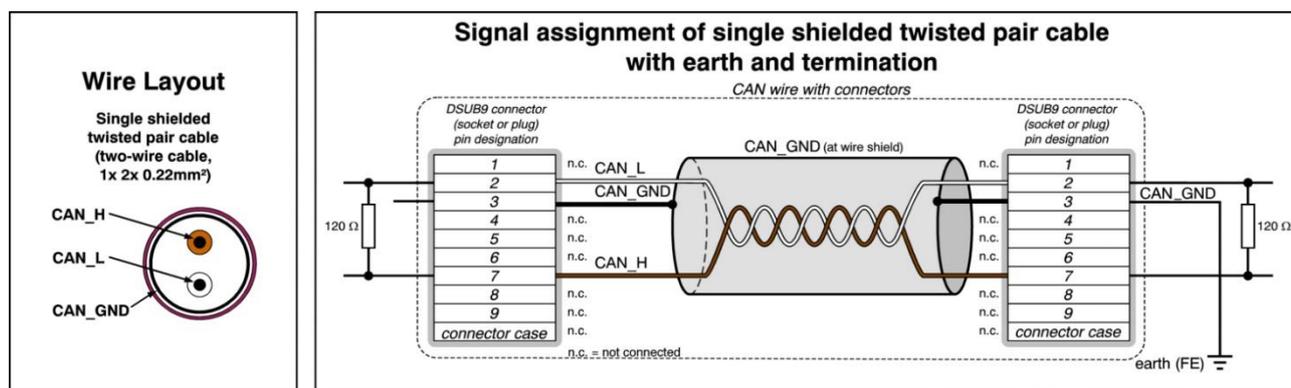

Figure 17: CAN wiring for light industrial environment

### 7.2.2 Cabling

- To connect CAN devices with just one CAN connector per net use a short stub ( $< 0.3$  m) and a T-connector (available as accessory). If these devices are located at the end of the CAN network, the CAN terminator “CAN-Termination-DSUB9” can be used.

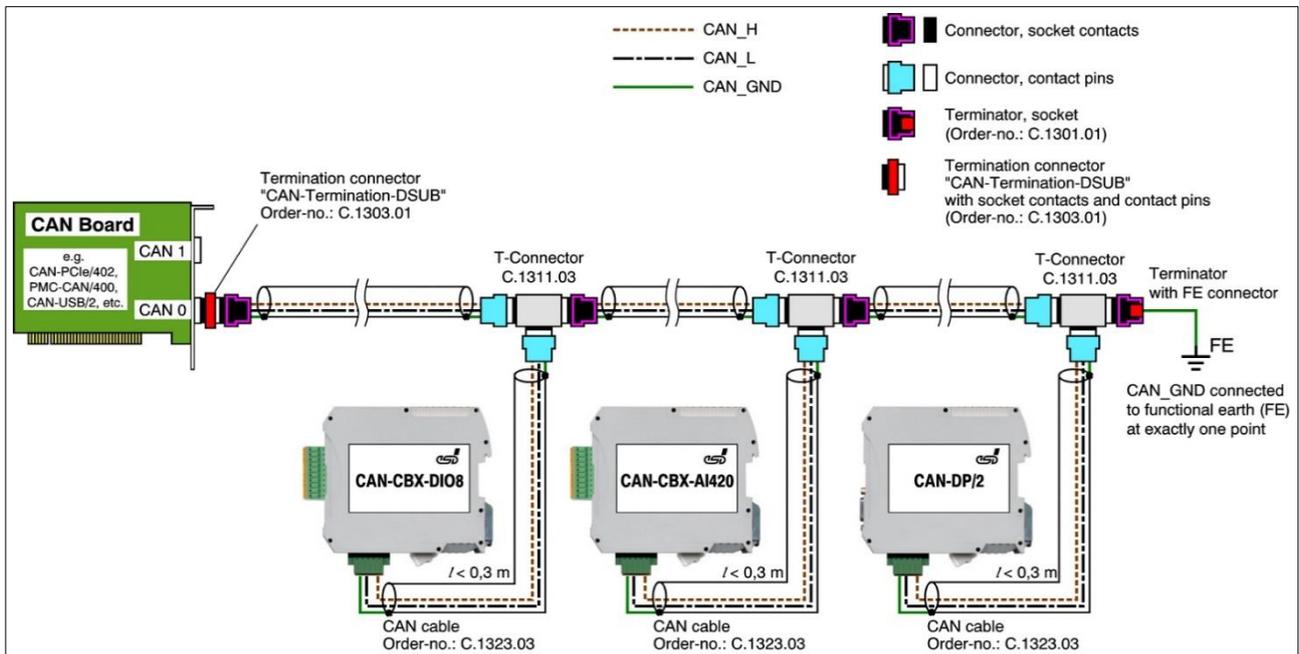

Figure 18: Example for proper wiring with single shielded single twisted pair wires

### 7.2.3 Branching

- In principle the CAN bus must be realized in a line. The nodes are connected to the main CAN bus line via short cable stubs. This is normally realized by so called T-connectors. esd offers the CAN-T-Connector (Order No.: C.1311.03)
- If a mixed application of single twisted and double twisted cables cannot be avoided, ensure that the CAN\_GND line is not interrupted!
- Deviations from the bus structure can be realized by using repeaters.

### 7.2.4 Termination Resistor

- A termination resistor must be connected at both ends of the CAN bus. If an integrated CAN termination resistor is connected to the CAN interface at the end of the CAN bus, this integrated termination must be used instead of an external CAN termination resistor.
- 9-pole DSUB-termination connectors with integrated termination resistor and pin contacts and socket contacts are available from esd (order no. C.1303.01).
- For termination of the CAN bus and grounding of the CAN\_GND, DSUB terminators with pin contacts (order no. C.1302.01) or socket contacts (order no. C.1301.01) and with additional functional earth contact are available.

## 7.3 Heavy Industrial Environment (Double Twisted Pair Cable)

### 7.3.1 General Rules

The following **general rules** for the CAN wiring with single shielded *double* twisted pair cable should be followed:

|   |   |
|---|---|
| 1 | A suitable cable type with a wave impedance of about $120 \Omega \pm 10\%$ with an adequate conductor cross-section ( $\geq 0.22 \text{ mm}^2$ ) must be used. The voltage drop over the wire must be considered.   |
| 2 | For heavy industrial environment use a four-wire CAN cable, the wires of which must be assigned as follows: <ul style="list-style-type: none"> <li>• Two twisted wires must be assigned to the data signals (CAN_H, CAN_L) and</li> <li>• The other two twisted wires must be assigned to the reference potential (CAN_GND).</li> <li>• The cable shield must be connected to functional earth (FE) at least at one point.</li> </ul> |
| 3 | The reference potential CAN_GND must be connected to the functional earth (FE) at exactly <b>one</b> point.   |
| 4 | A CAN bus line must not branch (exception: short cable stubs) and must be terminated with the characteristic impedance of the line (generally $120 \Omega \pm 10\%$ ) at both ends (between the signals CAN_L and CAN_H and <b>not</b> to CAN_GND).   |
| 5 | Keep cable stubs as short as possible ( $l < 0.3 \text{ m}$ ).  |
| 6 | Select a working combination of bit rate and cable length.  |
| 7 | Keep away CAN cables from disturbing sources. If this cannot be avoided, double shielded cables are recommended.  |

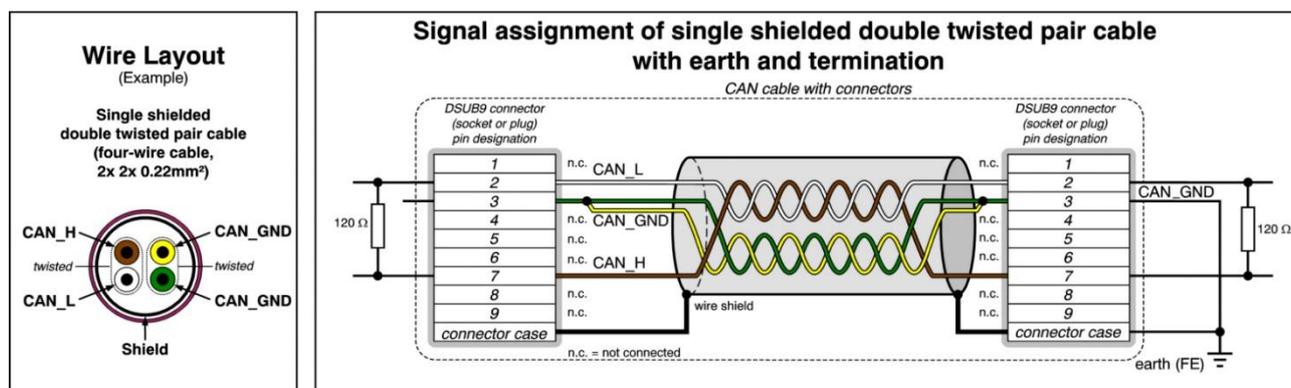

Figure 19: CAN wiring for heavy industrial environment

### 7.3.2 Device Cabling

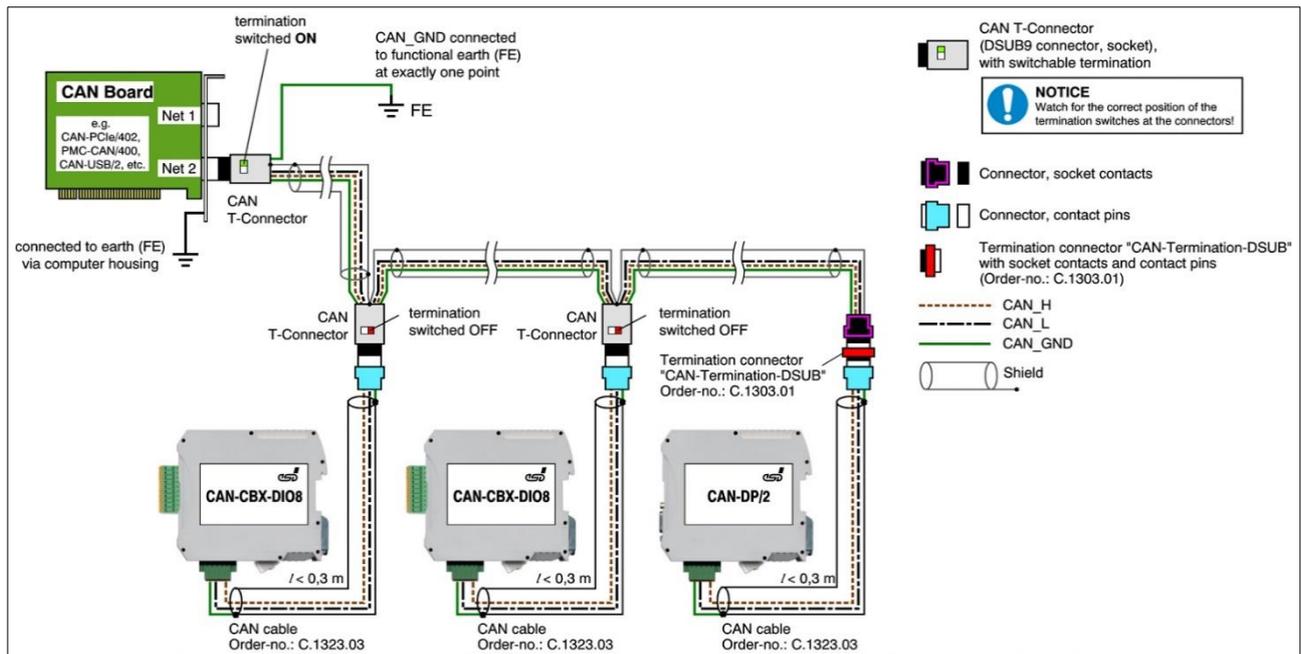

Figure 20: Example of proper wiring with single shielded double twisted pair cables

### 7.3.3 Branching

- In principle, the CAN bus must be realized in a line. The nodes are connected to the main CAN bus line via short cable stubs. This is usually realized via so called T-connectors. When using esd's CAN-T-Connector (order no.: C.1311.03) in heavy industrial environment and with four-wire twisted cables, it must be noted that the shield potential of the conductive DSUB housing is not looped through this type of T-connector. This interrupts the shielding. Therefore, you must take appropriate measures to connect the shield potentials, as described in the manual of the CAN-T-Connector. For further information on this, please refer to the CAN-T-Connector Manual (order no.: C.1311.21). Alternatively, a T-connector can be used, in which the shield potential is looped through, for example the DSUB9 connector from ERNI (ERBIC CAN BUS MAX, order no.:154039).
- If a mixed application of single twisted and double twisted cables cannot be avoided, ensure that the CAN\_GND line is not interrupted!
- Deviations from the bus structure can be realized by using repeaters.

### 7.3.4 Termination Resistor

- A termination resistor must be connected at both ends of the CAN bus. If an integrated CAN termination resistor is connected to the CAN interface at the end of the CAN bus, this integrated termination must be used instead of an external CAN termination resistor.
- 9-pole DSUB-termination connectors with integrated termination resistor and pin contacts and socket contacts are available from esd (order no. C.1303.01).
- 9-pole DSUB-connectors with integrated switchable termination resistor can be ordered for example from ERNI (ERBIC CAN BUS MAX, socket contacts, order no.:154039).

## 7.4 Electrical Grounding

- For CAN devices with galvanic isolation the CAN\_GND must be connected between the CAN devices.
- CAN\_GND should be connected to the earth potential (FE) at **exactly one** point of the network.
- Each *CAN interface with electrical connection to earth potential* acts as a grounding point. For this reason, it is recommended not to connect more than one *CAN device with electrical connection to earth potential*.
- Grounding can be done for example at a termination connector (e.g. order no. C.1302.01 or C.1301.01).

## 7.5 Bus Length

The bus length of a CAN network must be adapted to the set bit rate. The maximum values result from the fact that the time required for a bit to be transmitted in the bus system is shorter the higher the transmission rate is. However, as the line length increases, so does the time it takes for a bit to reach the other end of the bus. It should be noted that the signal is not only transmitted, but the receiver must also respond to the transmitter within a certain time. The transmitter, in turn, must detect any change in bus level from the receiver(s). Delay times on the line, the transceiver, the controller, oscillator tolerances and the set sampling time must be considered.

In the following table you will find guide values for the achievable bus lengths at certain bit rates.

| Bit Rate<br>[kbit/s] | Theoretical values of<br>reachable wire length<br>with esd interface $l_{\max}$<br>[m] | CiA recommendations<br>(07/95) for reachable<br>wire lengths $l_{\min}$<br>[m] | Standard values of<br>the cross-section<br>according to<br>CiA 303-1<br>[mm <sup>2</sup> ] |
|----------------------|--|--|--|
| 1000                 | 37   | 25   | 0.25 to 0.34   |
| 800                  | 59   | 50   | 0.34 to 0.6  |
| 666. $\bar{6}$       | 80   | -  |  |
| 500                  | 130  | 100  |  |
| 333. $\bar{3}$       | 180  | -  |  |
| 250                  | 270  | 250  |  |
| 166                  | 420  | -  | 0.5 to 0.6   |
| 125                  | 570  | 500  |  |
| 100                  | 710  | 650  | 0.75 to 0.8  |
| 83. $\bar{3}$        | 850  | -  |  |
| 66. $\bar{6}$        | 1000   | -  |  |
| 50                   | 1400   | 1000   |  |
| 33. $\bar{3}$        | 2000   | -  | not defined in<br>CiA 303-1  |
| 20                   | 3600   | 2500   |  |
| 12.5                 | 5400   | -  |  |
| 10                   | 7300   | 5000   |  |

Table 15: Recommended cable lengths at typical bit rates (with esd-CAN interfaces)

Optical couplers are delaying the CAN signals. esd modules typically achieve a wire length of 37 m at 1 Mbit/s within a proper terminated CAN network without impedance disturbances, such as those caused by cable stubs > 0.3 m.

### NOTICE

Please note that the cables, connectors, and termination resistors used in CANopen networks shall meet the requirements defined in ISO 11898-2. In addition, further recommendations of the CiA, like standard values of the cross section, depending on the cable length, are described in the CiA recommendation CiA 303-1 (see CiA 303 CANopen Recommendation - Part 1: “Cabling and connector pin assignment,” Version 1.9.0, Table 2). Recommendations for pin-assignment of the connectors are described in CiA 106: “Connector pin-assignment recommendations”.

## 7.6 Examples for CAN Cables

esd recommends the following two-wire and four-wire cable types for CAN network design. These cable types are used by esd for ready-made CAN cables, too.

### 7.6.1 Cable for Light Industrial Environment Applications (Two-Wire)

| Manufacturer  | Cable Type   |
|---|--|

### INFORMATION

Ready-made CAN cables with standard or custom length can be ordered from **esd**.

## 8 CAN Troubleshooting Guide

The CAN Troubleshooting Guide is a guide to finding and eliminating the most common problems and errors when setting up CAN bus networks and CAN-based systems.

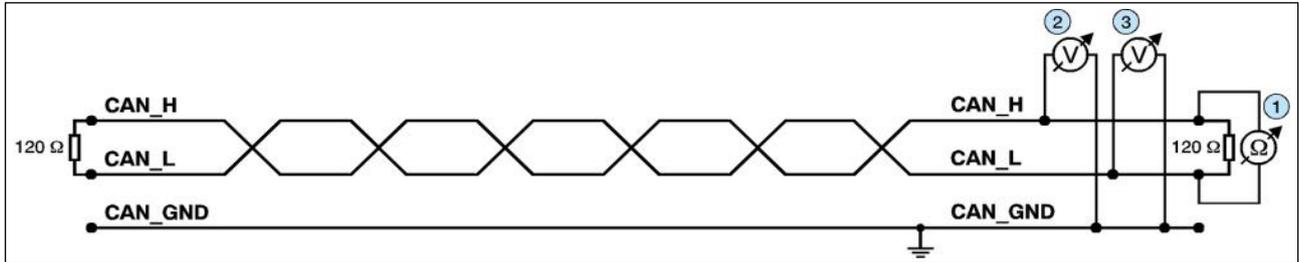

Figure 21: Simplified diagram of a CAN network

### Termination

The bus termination is used to match impedance of a node to the impedance of the bus line used. If the impedance is mismatched, the transmitted signal is not completely absorbed by the load and will be partially reflected back into the transmission line.

If the impedances of the sources, transmission lines and loads are equal, the reflections are avoided. This test measures the total resistance of the two CAN data lines and the connected terminating resistors.

### To test this, please proceed as follows:

1. Switch off the supply voltages of all connected CAN nodes.
2. Measure the DC resistance between CAN\_H and CAN\_L at one end of the network, measuring point ① (see figure above).

### Expected result:

The measured value should be between 50 Ω and 70 Ω.

### Possible causes of error:

- If the determined value is below 50 Ω, please make sure that:
  - There is no **short circuit** between CAN\_H and CAN\_L wiring.
  - **No more than two** terminating resistors are connected.
  - The transceivers of the individual nodes are not defective.
- If the determined value is higher than 70 Ω, please make sure that:
  - All CAN\_H and CAN\_L lines are correctly connected.
  - Two terminating resistors of 120 Ω each are connected to your CAN network (one at each end).

### 8.1 Electrical Grounding

The CAN\_GND of the CAN network should be connected to the functional earth potential (FE) at only **one** point. This test indicates whether the CAN\_GND is grounded at one or more points.

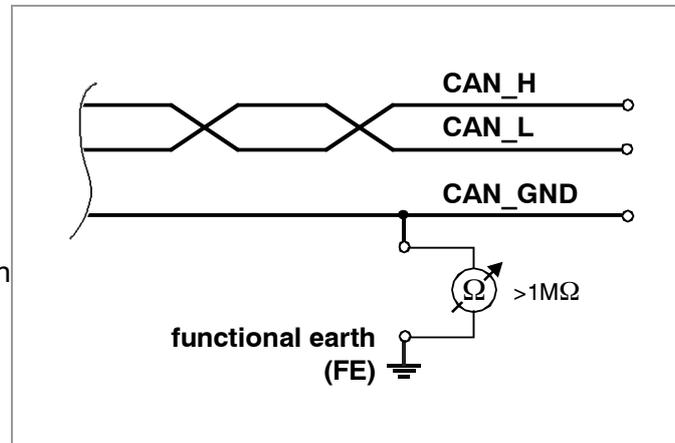

Please note that this test can only be performed with galvanically isolated CAN nodes.

**To test this, please proceed as follows:**

1. Disconnect the CAN\_GND from the earth potential (FE).
2. Measure the DC resistance between CAN\_GND and earth potential (see figure on the right).

Do not forget to reconnect CAN\_GND to earth potential after the test!

Figure 22: Simplified schematic diagram of ground test measurement

**Expected result:**

The measured resistance should be greater than 1 MΩ. If it is smaller, please search for additional grounding of the CAN\_GND wires.

### 8.2 Short Circuit in CAN Wiring

A CAN bus might possibly still be able to transmit data even if CAN\_GND and CAN\_L are short-circuited. However, this will usually cause the error rate to rise sharply.

Ensure that there is no short circuit between CAN\_GND and CAN\_L!

### 8.3 Correct Voltage Levels on CAN\_H and CAN\_L

Each node contains a CAN transceiver that outputs differential signals. When the network communication is idle the CAN\_H and CAN\_L voltages are approximately 2.5 V measured to CAN\_GND. Defective transceivers can cause the idle voltages to vary and disrupt network communication.

**To test for defective transceivers, please proceed as follows:**

1. Switch on all supply voltages.
2. Terminate all network communication.
3. Measure the DC voltage between CAN\_H and CAN\_GND, measuring point ②. (See “Simplified diagram of a CAN network” on previous page).
4. Measure the DC voltage between CAN\_L and CAN\_GND, measuring point ③. (See “Simplified diagram of a CAN network” on previous page).

**Expected result:**

The measured voltage should be between 2.0 V and 3.0 V.

## 9 Software Licenses

### NOTICE

The software from esd and from third parties used in the CAN-CBX-REL4/2 is subject to the license terms of the respective authors or rights holders. CAN-CBX-REL4/2 may only be used in accordance with these license terms!

By using the CAN-CBX-REL4/2 you agree to the terms of these software licenses.
